**January 2016**  
**EUROMOD version G3.0**

EUROMOD is a tax-benefit microsimulation model for the European Union (EU) that enables researchers and policy analysts to calculate, in a comparable manner, the effects of taxes and benefits on household incomes and work incentives for the population of each country and for the EU as a whole.

EUROMOD has been enlarged to cover 28 Member States and is updated to recent policy systems using data from the European Union Statistics on Income and Living Conditions (EU-SILC) as the input database, supported by DG-EMPL of the European Commission.

This report documents the work done in one annual update for Belgium. This work was carried out by the EUROMOD core developer team, based mainly in ISER at the University of Essex, in collaboration with a national team.

EUROMOD director: Holly Sutherland

EUROMOD executive director: Jack Kneeshaw

EUROMOD coordination assistant: Cara McGenn

EUROMOD developer responsible for Belgium: Daria Popova

National team for Belgium: Gerlinde Verbist, Josefine Vanhille & Tine Hufkens (University of Antwerp), André Decoster & Toon Vanheukelom (University of Leuven).

The results presented in this report are derived using EUROMOD version G3.0. EUROMOD is continually being improved and the results presented here may not match those that would be obtained with later versions of EUROMOD. For more information, see: <https://www.euromod.ac.uk>

This document is supported by the European Union Programme for Employment and Social Solidarity – PROGRESS (2007-2013).

This programme is managed by the Directorate-General for Employment, Social Affairs and Inclusion of the European Commission. It was established to finally support the implementation of the objectives of the European Union in the employment and social affairs area, as set out in the Social Agenda, and thereby contribute to the achievement of the Lisbon Strategy goals in these fields.

The seven-year Programme targets all stakeholders who can help shape the development of appropriate and effective employment and social legislation and policies, across the EU-28, EFTA-EEA and EU candidate and pre-candidate countries.

PROGRESS mission is to strengthen the EU contribution in support of Member States' commitment. PROGRESS is instrumental in providing analysis and policy advice on PROGRESS policy areas; monitoring and reporting on the implementation of EU legislation and policies in PROGRESS policy areas; promoting policy transfer, learning and support among Member States on EU objectives and priorities; and relaying the views of the stakeholders and society at large.

## 1. BASIC INFORMATION

### 1.1 Basic information about the tax-benefit system

- The social security system and tax system are both almost entirely coordinated at the national level. However, a number of taxes and benefits do not belong to the national system and vary according to the regions.

The revenue from taxation is collected at the national level and then it is divided over the different institutional levels (the federal level, the different regions (Brussels/Flanders/Wallonia) and the communities (Flemish community and French-speaking community)). Only municipalities' tax rates vary. Their collection however also takes place at the national level, after which these are transferred to the municipalities. The main exception in the national collection of taxes is the tax on real estate. This tax is administratively coordinated by the regions, while tax rates are set by the municipalities. Its revenue is split over the different administrative levels (municipalities, provinces, regions).

Benefits that are part of the social security system (unemployment, pensions, sickness and disability benefits, family allowances, income support) are within the competence of the federal government. The most important benefits that are within the competence of the regions are as follows. First, there are the benefits related to education (study allowances). Second, additional social assistance (in addition to income support) is also a regional matter. Third, since the mid-2000s, the compulsory "Flemish care insurance" was established, which is only applicable for inhabitants of the region of Flanders and optionally available for the inhabitants of Brussels.

- The fiscal year runs from 1<sup>st</sup> January to 31<sup>st</sup> December. Main benefit changes usually take place when price-indices reach a certain level. However, as wages increase at a higher pace than the indices, additional adjustments can also take place "outside the index". This is possible when governments and social partners agree on the amount the benefits have to be raised to ensure they do not drop below subsistence levels.
- The official state pension age is 65 for men as well as for women. Before, there was a slight discrepancy between the pension age of men and women (2003-2005: 63 for women; 2006-2008: 64 for women). However, for a number of professions (miners, seafarers), exceptions to this rule apply. In general, however, the average effective retirement age is considerably lower, mainly due to systems of early retirement and supplementary unemployment benefits for older unemployed.
- Nursery classes for all children from the age of three onwards are free of charge and universally accessible. Although the compulsory education age is 6 years, the enrolment rate in the Belgian nursery classes is traditionally very high. Being in education is compulsory from the age of 6 onwards, but since September 2009, children should at least have attended one year of nursery school to be admitted to primary school at the age of 6. Compulsory education counts until the age of 18 (by attending school or by homeschooling). Exceptions can be made from the age of 15 onwards. Pupils in an education stream leading to a specific, mostly technical profession can make use of an apprenticeship agreement, and combine part-time school attendance with working part-time in a firm, exercising their profession under guidance there.

For the family allowances, dependent children are in principle all children under 18 years. There are two exceptions to this rule. On the one hand, the child remains dependent until 21 if he or she is disabled. On the other hand, a child can remain dependent until the age of 25 if he or she is in full-time education (including higher and advanced education), not married, and his/her net taxable income as well as the number of days a gainful occupation has been exercised do not exceed certain thresholds. The income thresholds are slightly higher for

handicapped children as well as for children of lone parents. To qualify as a dependent child in the taxation system, the age restrictions are not applicable. The income thresholds are the same as for the family allowances.

- In the taxation system and social assistance system, a lone parent is defined as a parent of resident dependent children, who does not legally cohabit with or is married to a partner (whether or not the partner is the parent of the child is irrelevant).

In the taxation system, the amount of certain allowances depends on whether one is disabled to a certain degree. The degree is often expressed either as % decrease in functioning capacities or as points on a medical scale capturing the ability to live independently, and is being declared by a doctor. The threshold often employed for taxation allowances is a handicap of 66% or 9 points.

- The income tax system is an individual system. However, in the case of couples with a single earner, the system of the marital quotient applies. This consists of treating 30% of the total earnings of the couple as the income of the non-earning spouse (with a certain maximum). As a consequence of the progressivity of the Belgian tax rates, this amount is taxed at the lowest marginal tax rate instead of at the higher rate of the bracket in which the single earner's income would fall when treated as one entity.
- Capital income is usually taxed at the moment of remittance. This liberates the recipient from the obligation to declare the amounts in the tax return. If the capital income was not taxed at the moment of remittance, it has to be declared. It will then be taxed at a flat tax rate of 15%, except if it is beneficial for the recipient to treat capital income as regular income and to tax it at the standard rates (and brackets).
- All earning individuals are obliged to fill in a tax return if their income exceeds the minimum taxable income, except if their income consists entirely of a state pension or real estate income that is taxable only at the rate of cadastral income. As withholding tax is calculated taking only a few characteristics into account, differences between withholding tax and the final amount due are often considerable. A clearance of the balance usually takes place in the first half of the second year after the period in which the income has been received.
- All benefits and tax brackets are indexed to take account of inflation. Benefits usually rise every time price-indices reach a certain level. Tax brackets and all related amounts are indexed on a yearly basis at the transition to the next fiscal year.
- Social assistance (the most important means-tested benefit in place) assesses entitlement according to benefit unit income. The benefit unit is the nuclear family - the couple (cohabiting or married) or single adult plus any dependent children. However, income from other first degree family members living together under the same roof and pooling income sources are taken into account for the means-test. Being assessed is the factual income at the moment of application for social assistance at the local Centre for Public Assistance (CPAS). The applicant has to declare all factual income, not only official. Some income sources (e.g. child benefits) are discarded in the means-test. The applicant/beneficiary is bound to provide all the necessary information and to contact the CPAS if something changed in his or her personal (financial) situation. The CPAS are obliged to revise the means-test on a yearly basis. However, it belongs to the discretionary power of the local Social Service Departments to do the assessment on a more frequent basis.

### 1.2 Social Benefits

This is an overview of the existing social benefits in Belgium. Our classification is thematic, which means that not all the benefits in one category are within the competence of the same administrative institution. For instance “guaranteed child allowances” are classified here under “family allowances”,

while administratively this measure is part of social assistance. This overview includes all social benefits, including those currently not simulated within EUROMOD.

### 1.2.1 Pensions

State pensions are financed by a “pay-as-you-go system”. This means that pensions of the currently retired are financed by contributions on wages of the currently employed (and not by their own savings). In addition to the state pension schemes listed hereunder, second pillar pensions provide a supplementary pension to employees, which is being built via the employer. Although it is voluntary, half of the Belgian working population takes part in a second pillar pension scheme, and its importance is increasing.

- *Old age pension*

In the state pension system (first pillar), three schemes are in place, depending on whether the retired person was an employee, a civil servant or a self-employed. For those workers who have fallen into more than one of these categories during their career, the rights acquired in the various systems are combined. Periods of involuntary unemployment (unemployment, sickness) are also taken into account. Besides the category one belongs to, the monthly benefit depends also on the course of one’s career, the earned wages and the family situation. Replacement rates for retired employees are typically 75% in the case of single earner couples, and 60% for all other pensioners. Because of upper ceilings on the pension amounts, the replacement rates for higher earners will in general be considerably lower.

- *Survivor pension*

The survivor pension is granted to the spouse following the death of the person who has built up pension rights. A few additional conditions apply (the spouse has to be over 45 years of age and be married for at least one year, or have a dependent child, or be permanently disabled).

- *Minimum pension (income guarantee for the elderly)*

A minimum pension is a right granted to all Belgian citizens. As it actually belongs to the social assistance category, it is discussed under this heading and its official name: income guarantee for the elderly (see 1.2.4.b.)

- *Early retirement pension*

Early retirement pension is actually an unemployment benefit and is discussed under this heading as well (see 1.2.2.c.). The normal benefit is raised with an additional compensation, usually paid for by the former employer. Also, the early retired are exempt from the obligation to actively seek work that is common for the “normal” unemployed.

### 1.2.2 Unemployment benefits

Concerning unemployment benefits, three categories of recipients can be distinguished. Firstly, there are the indemnified unemployed. Under this heading the ordinary unemployment benefits are classified, but also the early retirement benefits. Secondly, some categories of employed persons are additionally being supported with unemployment benefits, for instance during temporary unemployment or during training. The third category consists of employees who reduce their working hours with the support of unemployment benefits.

- *The indemnified unemployed*

- a. *Ordinary unemployment benefits (after employment)*

This category includes both jobseekers and persons exempt from seeking work, such as those exempt because of social or familial reasons (and the older employees and early retired discussed in the next paragraph). The amount of the unemployment benefit is calculated on the basis of the previous salary, and a ceiling applies that is different depending on unemployment status. The replacement rate that applies thus depends on family situation (single, cohabitating, head of the family) and the length of the unemployment (digressive over time).

*b. Full-time early retirement*

What is described here as “early” retirement is in fact a “bridge” between losing a job before the (legal) age of retirement and the actual retirement. Therefore, a part of this benefit is financed through the unemployment legislation and a part by the employer. The early retired are exempt from the obligation to actively seek work.

*c. Unemployment benefit for older employees*

The older employees can be exempt from the obligation to seek work as well. In addition to the regular unemployment benefit, they receive an additional compensation, called the “seniority supplement”, which is paid for by the former employer.

*d. Unemployment benefit after finishing studies*

Persons younger than 30 and without an employment history can receive unemployment benefits after finishing studies. The applicant must have finished his or her studies, be enrolled as a jobseeker for 310 workdays before he or she becomes eligible to receive the benefit. The benefit varies, depending on age and family situation (living alone, dependent family, etc.). The system was reformed in 2012, including a renaming of the benefit from “waiting allocation” to “professional integration allocation”.

- ***Support of employed people***

*a. Temporary unemployed*

In contrast to the fully unemployed (discussed above), the temporary unemployed is bound by an employment contract, of which however the actual work is temporarily suspended (e.g. because of economic circumstances or weather conditions). Replacement rates are slightly higher than for the fully unemployed and do not decrease over time.

*b. Part-time unemployed with preservation of rights and income guarantee benefit*

Employees avoiding full unemployment by working part-time, can preserve the rights of a full-time unemployed and can receive an income guarantee benefit when he or she fulfils a number of conditions with regard to reference gross wage and effort (apply for a full-time job with the employer if it becomes available).

*c. Activation measures allowances*

A first measure consists of the exemption from seeking work while receiving the unemployment benefit for those who follow a course that is organized or subsidized by the regional departments of the employment agency, or an individual in professional training in a company or educational institute. Secondly, there are a number of ways in which unemployed who resume work, continue to be supported by the National Employment Office. A part of the wage consists of an activation measure allowance (mostly for jobs in the social economy sector such as sheltered workshops, community work or home help).

- ***Support for the employed who reduce their working hours***

*a. Part-time early retirement*

Full-time employees have the possibility to reduce their working hours, while receiving an additional supplement to the part-time wage (paid partly by the employer and partly by the National Employment Office), from the age of 55 years onwards.

*b. Time credit*

Employees can interrupt their career full-time or part-time for a certain period. During this period, they remain under the same employment contract and receive compensation from the National Employment Office in the form of a career break allowance. After the break, they are entitled to the same rights as before. Different systems are elaborated for the different sectors ('time credit' is the name for the measure in the private sector). In each of the systems, besides a normal form, three special forms exist, targeted at specific needs to interrupt ones career (parental leave, palliative care leave, and medical assistance).

• ***Sickness & Disability Benefits***

*a. Primary incapacity of work (sickness benefit)*

This term is applicable during the first year during which a person is medically incapable of work, but not because of an occupational injury or disease. The (degree of) incapacity of work has to be recognized by a doctor approved by the social security office. The system exists for both employees and self-employed. In any case, the person should have paid a certain amount of social contributions to be eligible for this benefit. During the first month of work incapacity, employees receive 60% of their gross wage (with a maximum dependent on family situation). From the second month onwards this is decreased to 55% for employees without dependants. Self-employed receive a fixed amount per day depending on the family situation.

*b. Disability benefit*

The difference between the disability scheme and the sickness scheme is that the disability scheme starts after one has medically incapable of work for more than one year. For the employees, there is a difference in the replacement rates:

- 65% of the gross wage, if the person has dependants
- 55% of the gross wage in the case of a single person
- 40% of the gross wage when the person lives with someone else

All payments are subject to maximum limits per day. The disability benefit for the self-employed is increased by 3 to 4 €/day in the case the business is discontinued.

*c. Occupational injury*

Workers are covered by an insurance against accidents at work, which each employer is obliged to have. Not only accidents which occur at the workplace but also accidents which happen on the way to or from work are classified as accidents at work. Self-employed persons are not automatically insured against accidents at work. A separate rule applies to civil servants.

*d. Occupational disease*

There is a list of disorders which are recognised as occupational illnesses and which entitle the person suffering from one of the disorders to compensation. People who suffer from an illness not included on the list must prove that there is an established and direct link between the illness and their work. The benefit is paid for by the Fund for Occupational Diseases. If the disease is of a temporary nature, the replacement rate is 90% of the last wage. In the case when one becomes permanently disabled, the benefit is calculated according to the degree to which one is declared disabled (in %) and the last wage. All workers and civil servants are insured against occupational illnesses, self-employed persons are not.

*e. Maternity leave*

Maternity leave consists of a period of 15 weeks around the birth of the child, during which the female employee is indemnified by the National Sickness and Invalidity Insurance Institute. The allowance amounts to 82% of the normal wage for the first 30 days of the leave. Afterwards, the replacement rate is reduced to 75%, limited with an installed maximum amount. The 15 weeks can be spread around the foreseen birth date as the mother wishes, starting at the earliest six weeks before the foreseen birth date. In the case of multiple births, maternity leave is extended with two weeks.

*f. Paternity leave*

Paternity leave guarantees for each employee within a period of four months after the birth of the child a leave of 10 days (to be spread as one wishes). During the first three days, the employer continues to pay the full wage. The other days, the National Sickness and Invalidity Insurance Institute pays an allowance of 82% of the wage, limited with a maximum amount per day.

### 1.2.3 Family Allowances

- *Ordinary child allowance*

Child allowance is paid to families with dependent children. In principle, children are dependent if they are younger than 18 years old. There are two exceptions to this rule. On the one hand, the child remains dependent until 21 if he or she is disabled. On the other hand, a child can remain dependent until the age of 25 if he or she is in full-time education (including higher and advanced education), not married, and if his/her net taxable income as well as the number of days a gainful occupation has been exercised does not exceed certain thresholds. The income thresholds are slightly higher for handicapped children as well as for children of lone parents.

In general a beneficiary, usually the father, is eligible for child allowance if his employer (or himself if he is the self-employed) pays or paid social security contributions. The relevant rules for the computation of child allowances depend on the contribution scheme to which the employer of the beneficiary or the beneficiary himself contributed: the contributory scheme for wage earners on the private labour market, for wage earners on the public labour market (either statutory or contractual) or for the self-employed. If a beneficiary did not contribute to any of the social security contribution schemes he or she may still be eligible for child allowance through the system of guaranteed child allowance. The amount of child allowance depends on the birth order of the child. The guaranteed child allowance is means tested. Allowances for orphans do not depend on the child's birth order.

- ***Supplements to the ordinary child allowance***

- a. *Age-related supplements*

Age-related supplements are the same for all schemes as well as for orphans and guaranteed child allowance. Only for the self-employed scheme there is a difference in that there is no age supplement for the youngest child that gives right to child benefits nor is there an age supplement for an only child.

- b. *Social supplements*

The social supplements are primarily for children of beneficiaries that receive a replacement income: retirement pension, survival pension, unemployment benefits (full-time and longer than six months in unemployment), and disability benefits. There are income conditions that must be met by the beneficiary in order to be eligible for social supplements to child benefits.

- c. *Supplements for disabled children*

Ordinary child allowances and orphan allowance can be supplemented with an allowance for handicapped children of up to 21 years of age and if the child has a disability of at least 66%. The amount of the supplement is based on the consequences of the condition both for the child himself/herself and for the family in the sense of a diminished degree of social activity and participation.

- ***Birth allowance***

The birth allowance for the first-born is higher than for all following births. If the first-borns are twins then the amount for a first-born applies for both. A birth allowance can also be given in case of miscarriage as long as the pregnancy has lasted at least 180 days.

- ***Adoption premium***

An adoption premium is granted at the moment of adoption and is independent of the contribution scheme.

### 1.2.4 Social Assistance

- ***Income support***

If the means of a person are below a certain threshold, that person is eligible for income support. Income support is provided up to the level of the minimum income, i.e. the amount of the benefit is equal to the minimum existence level minus the own means. In principle one needs to apply for social assistance at a local centre for public assistance (CPAS), a body which is present in each municipality. The CPAS have some discretionary power over the acceptance. For example, the CPAS can demand an individualized project for social (re)integration that the applicant has to agree to and follow in order to get and/or keep social assistance. The income support is for unlimited duration but each year the CPAS has to make a re-assessment of the personal situation of the applicant and can withdraw income support based on the results of that inquiry. The beneficiary is bound to contact the CPAS from the moment something changed in his or her personal (financial) situation. The benefit unit is the nuclear family - the couple (cohabiting or married) or single adult plus any dependent children. This means that if a person claims income support his/her spouse is automatically covered, i.e. (s)he cannot claim income support separately. However, income from other first degree family members living together under the same roof and pooling income sources are taken into account for the means-test. Being assessed is the factual income at the moment of application for social assistance at the local Centre for Public Assistance (CPAS). The applicant has to declare all factual income, not only official. Some income sources (e.g. child benefits) are discarded in the means-test

- *Income Support for the Elderly*

All persons aged 64 or above are eligible to receive income support for the elderly. There is a distinction for persons living alone and those living with others at the same address. A person without a partner but living with (a) minor child(ren) or adult child(ren) for whom child benefits are received and/or relatives (descendants) are considered as living alone and are eligible to receive the increased amount. Income support for the elderly is an individual right whether being married or not.

- *Contribution towards disabled persons*

Disabled persons receive an allowance in line with their age and level of disability. The parents of disabled children receive higher child allowance if the child (until the age of 21) is at least two-thirds disabled. Disabled persons older than 21 receive an income replacement benefit if they can prove that their ability to earn an income is reduced by two-thirds compared to that of a non-disabled person. The disabled person receives an integration allowance if a medical examination shows that the person's ability to live independently is restricted.

### 1.2.5 Other

- *Flemish care insurance*

The recently installed Flemish care insurance (2002) is an exception to the nationally organized social security system. It is a collective insurance to provide partial reimbursement for the costs of care (informal care, professional home care, or professional residential care). The care insurance is compulsory for inhabitants of Flanders, and optionally available to inhabitants of Brussels and to Europeans working in Belgium. The annual fee - €25 (in 2012) per person older than 25 - is to be paid to the health insurance fund one is registered with.

### 1.2.6 Scope and scale

Table 1. Social benefits: recipients (as % of population)

	2012	2013	2014	2015
<b>Total population</b>	<b>11,035,948</b>	<b>11,099,554</b>	<b>11,150,516</b>	<b>n.a.</b>
Pensions (old age + survivors)	19.62%	19.90%	20.16%	n.a.

Social assistance	1.42%	1.47%	1.51%	n.a.
Income support*	0.95%	0.98%	1.00%	n.a.
Income support for the elderly	2.37%	2.45%	2.51%	n.a.

Notes: All categories group the different social insurance schemes. (\*) for income support, the number of benefit units is taken as an approximation for the number of recipients. However, in the third category of income support, at least two people (and possibly the whole family) are the beneficiaries of the benefit. Only counting the benefit unit implies that these families only count for “one” person. Therefore, it can be expected that the

number presented, which refers to the number of benefit units, is a serious underestimation of the number of people that benefit from the social assistance. However, no statistics are held on the number of beneficiaries inside the benefit units, so it was impossible to calculate the percentage of *persons* that are recipients.

### 1.3 Social contributions

Social insurance contributions are different for wage earners on the public and private labour market, for blue and white collar workers, and for earned wages and for replacement income.

**Employers:** employers' social insurance contributions are calculated on the gross wage. The final total ratio ranges from 33% to 40.73% of the gross wage, dependent on the size of the firm and whether the employee is a blue or white collar worker.

**Employees:** social insurance contributions are paid on total gross earnings without ceiling and before income tax deductions. The tax base includes any advantages in money (and a limited number of fringe benefits), granted by the employer to the employee as a remuneration for the labour supplied. The standard rate of the social insurance contribution is 13.07% of total gross earnings. Social insurance contributions are calculated slightly differently for some income components of blue collar workers and white collar workers.

**Civil servants:** Social insurance contributions for wage earners on the public labour market *without statutory service* are the same as those for wage earners on the private labour market. The social insurance contributions for civil servants *with statutory service* are different than those for wage earners. The standard rate of the social insurance contribution for the civil servant is 11.05% of total gross earnings.

**The self-employed:** The full-time self-employed pay social insurance contributions on a quarterly basis based on their income in the third calendar year preceding the year of contribution. If the self-employed has not yet been active for three years a lump sum amount of contributions is levied which will be regulated later against real earned income.

**Retirement pensions, survival pensions and early retirement pensions:** Retirement and survival pension benefits are subject to a social insurance contribution of 3.55% for the funding of sickness and disability insurance. However, if the contribution would bring the pension amount below a certain threshold no contributions are due.

**Disability benefits:** On disability benefits received by wage earners a social insurance contribution of 3.5% is due to fund the pension insurance scheme. Again the contribution may not be due if the amount of benefits falls below a certain threshold. No contributions are due on benefits for primary disablement (first year).

**Occupational injury and disease:** The percentage applicable is 13.07% on benefits for either permanent or temporary disablement but no contribution is due on benefits for assistance by a third person.

**The unemployed:** do not pay social insurance contributions.

**Special professional categories:** a number of exceptions to the general calculation rules apply for a number of professional categories (independent child minders, seafarers, professional athletes with an employment contract, waiters, students employed by student contract, seasonal workers in horticulture or agriculture). Exceptions exist for both employee as well as employer contributions.

## 1.4 Taxes

### 1.4.1 Personal income taxes

Personal income taxes are calculated by applying a progressive rate structure to the net taxable income of an individual person. Net taxable income equals gross income minus the sum of social insurance contributions, professional expenses (only for working persons), and deductible expenses. For a more detailed description of the tax system, refer to section 2.6.

The tax calculation system is individual; however, in order to apply the correct credits and allowances, the level at which the tax return is to be filled is the nuclear family: the single person or married couple together with dependent children (and, occasionally, other dependent persons). To qualify as dependent the person's own income may not surpass certain limits. Otherwise the person is considered a separate tax unit.

In the case of one-earner couples the tax legislator allows for income sharing between spouses up to a certain limit. If one of the spouses earns less than 30% of total net taxable income from professional activity, income between spouses is shared as if the higher earning spouse earned 70% of total household income from professional activity and the other spouse 30%.

Replacement incomes are taxable with the exception of social assistance, war pensions and benefits in case of a work-related accident or sickness for a person without any other income. Furthermore, replacement incomes give right to a tax credit, and total taxes on replacement income can be reduced to zero if they are below a given threshold and are the sole source of income.

### 1.4.2 Property and wealth taxes

Real estate taxes for house-owners are regulated at the regional level. The tax base is the “cadastral income”, an estimate of the hypothetical annual net rental income of the property. This is taxed at a basic levy rate of 2.5% for the Flemish Region and at a 1.25% rate for the Brussels-Capital Region and the Walloon Region. The municipalities decide on the level of the surtax (opcentiemen/centimes additionnelles). Reductions apply for specific family situations (having children, disabled household members), modest size and energy-efficiency of the dwelling. The real estate taxes are organised and collected at the regional level (slightly different systems apply in Brussels, Flanders and Wallonia).

Investment income is taxed at the source. On income from dividends, a 25% rate applies. Interest income from bonds is taxed at 15%, as is interest income from ones savings account. For natural persons, however, this last category is exempt from taxation as long as the interest income does not exceed a certain maximum amount.

For individuals or households, there exists no property tax on assets (or wealth tax). However, a number of taxes do apply on transactions of property (both movable and immovable). For immovable property, the most important category consists of registration taxes. For movable property, the main tax is the tax on stock exchange and carry-over transactions.

The inheritance tax can be seen as a form of wealth tax for individuals. This is a complex system with different rates (ranging from 3% to 80%) applying to different forms in which an inheritance can take place (money or in kind, descendants of which order).

### 1.4.3 Taxes on goods and services

The standard VAT rate is 21%. A lower rate of 6% exists for basic needs goods and services (e.g. food, books, pharmaceutical products, coffins) or 12% on a very limited number of intermediate-needs goods and services (e.g. construction of social housing).

Excise duties are levied on a number of products. Some important examples are mineral oils, tobacco, various alcoholic beverages, packaging.

A tax applies to individuals and corporations owning motor vehicles. The amount due depends on the type of motor vehicle, the cylinder capacity, the horse power and the type of fuel used.

## 2. SIMULATION OF TAXES AND BENEFITS IN EUROMOD

### 2.1 Scope of simulation

Not all the taxes and benefits mentioned in the previous section are simulated by EUROMOD. Some are entirely beyond its scope. Others are not possible to simulate accurately with the available data. They are included in the final output, but the rules governing them may not be changed by the model. Table 1 lists the main benefit categories, Table 2 the social insurance contributions and taxes.

Table 4. Simulation of benefits in EUROMOD

	Variable name(s)	Treatment in EUROMOD				Why not fully simulated?
		2012	2013	2014	2015	
Pensions	poa, psu	I	I	I	I	No data on contribution history
Unemployment benefits	bun, byr	I	I	I	I	In the baseline simulation, UBs are taken from the data.
Ordinary UB	bun_s	PS	PS	PS	PS	Simulation of UB and is implemented for new unemployed and is based on a number of assumptions. See below.
Early retirement benefit	byr_s	PS	PS	PS	PS	
Sickness & Disability benefits	pdi, phl	I	I	I	I	No information on disability
Family benefits						
Maternity leave	bma	I	I	I	I	No data to simulate
Child allowance	bch_s	S	S	S	S	No information on disability: child allowance for disabled children not simulated
Birth allowance	bchba_s	S	S	S	S	
Education related allowances	bed	I	I	I	I	No data to simulate
Social assistance						
Income support	bsa_s	S	S	S	S	Simulation of IS is based on a number of assumptions
Income support for elderly	bsaoa_s	S	S	S	S	Simulation of IS for the elderly is based on a number of assumptions and switched OFF in the baseline
Housing benefit	bho	I	I	I	I	No data to simulate

Notes: “-”: policy did not exist in that year; “E”: *excluded* from the model as it is neither included in the micro-data nor simulated; “I”: *included* in the micro-data but not simulated; “PS” *partially simulated* as some of its relevant rules are not simulated; “S” *simulated* although some minor or very specific rules may not be simulated.

Table 5. Simulation of taxes and social contributions in EUROMOD

	Variable name(s)	Treatment in EUROMOD				Why not fully simulated?
		2012	2013	2014	2015	
<b>Social contributions</b>						
Employees	tscee_s	S	S	S	S	Calculations for self-employed are based on the number of assumptions
civil servants	tscee_s	S	S	S	S	
self-employed	tscse_s	S	S	S	S	
Pensions	tspe_s	S	S	S	S	
Disability	tsdb_s	S	S	S	S	
special contribution	tscesp_s	S	S	S	S	
<b>Taxes</b>						
Personal income tax	tin_s	S	S	S	S	A uniform tax rate of 15% is assumed
Real estate	tinprtahm_s	S	S	S	S	
Investment income tax	tinkt_s	S	S	S	S	
Property transactions	-	E	E	E	E	No information available
Inheritance	-	E	E	E	E	No information available
VAT	-	E	E	E	E	No information available
Excise duties	-	E	E	E	E	No information available
Motor vehicle tax	-	E	E	E	E	No information available

Notes: “-” policy did not exist in that year; “E” policy is *excluded* from the model’s scope as it is neither included in the microdata nor simulated by EUROMOD; “PS” policy is *partially simulated* as some of its relevant rules are not simulated; “S” policy is *simulated* although some minor or very specific rules may not be simulated. Although there is a variable in SILC for property/wealth taxes, it is empty for Belgium, so it cannot be included in the model.

### 2.2 Simulated policies and order of simulation

#### 2.2.1 Simulated policies

- *Order of the simulated policies*

Table 11 shows the order of simulation (i.e. the spine).

At the beginning of the spine, in the policy called BTA\_be, the user finds the switch related to the take-up correction of Income Support. In the baseline, the correction is switched ON and simulated values of Income Support are included in the disposable income. See section 1.3.3, for more details.

The first four policies concern the simulation of the social insurance contributions: for employees (including civil servants), for employers, for the self-employed, for pensioners (including early retirement pensioners), and for disability benefits. The social insurance contributions are deducted from gross income in order to calculate taxes.

For workers, professional expenses are additionally deducted in order to attain the taxable income. They are computed in the policy tintace\_be.

The next policy tinwh\_be contains the withholding tax legislation. In the baseline this policy is switched off, as the standard approach is to calculate final taxes.

Policies bun\_be and byr\_be, which follow next, are also switched off in the baseline. They can be used for calculation of unemployment benefits for new unemployed (e.g. for modelling employment transitions or for calculation of replacements rates).

The following policies tprhm\_be and tin\_be calculate the final taxes.

After calculation of taxes due there is also a special contribution for social security (due by all wage earners). This contribution is computed separately since it is applied after taxes and hence does not influence net taxable income.

Following the contributions and taxes, the benefits are simulated. Family allowances include the birth allowance and the child benefits. Next, the most important categories of social assistance are simulated (income support as well as income support for the elderly). The latter is switched off in the baseline (see section 2.3.4. for more details).

Table 6. Simulated policies

Section	Policy	Description	Main output	Year

2.3.4	bsaoa_be	Income support for the elderly	bsaoa_s	OFF	OFF	OFF	OFF

## 2.2.2 Structural changes in simulated policies, 2012-2015

- **Unemployment benefit**

- Increased dependency of benefit amounts on time spent in unemployment*

From 2013 onwards, the unemployment benefits become more dependent on the time that is spent in unemployment and one's work history before becoming unemployed. Benefits during the first three months are increased, and are thereafter decreased more rapidly over time. Also minimum limits for single persons and heads of family are lowered. Exceptions apply for persons with a work history of more than 20 years, for the elderly unemployed (55+), and persons with a disability of at least 33%.

A complex bracket system with more than 60 categories is introduced, making the amount of benefit received closely dependent on the time spent in unemployment and previous work history. Because exactly this information is lacking from the SILC data, the simulation of the unemployment benefits is only a rough approximation.

- Waiting period*

The waiting period to receive unemployment benefits after studies is changed in 2012 from an age-dependent system to an age-independent system.

- **Work bonus (reduction of social insurance contribution)**

The two brackets of the working bonus are abolished in favour of only one (cf. section 2.4.1; Table 28)

- **Regional tax credit**

From 2011 the regional tax credit is abolished.

### 2.3 Social benefits

#### 2.3.1. Child allowance (kinderbijslag / allocations familiales) (*bch\_s*)

- *Brief description*

Child allowance is paid to families with dependent children. In principle, children are dependent if they are younger than 18 years old. There are two exceptions to this rule. On the one hand, the child remains dependent until 21 if he or she is disabled. On the other hand, a child can remain dependent until the age of 25 if he or she is in full-time education (including higher and advanced education), not married, and his/her net taxable income as well as the number of days a gainful occupation has been exercised do not exceed certain thresholds. The income thresholds are slightly higher for disabled children as well as for children of lone parents. In EUROMOD the child benefits are simulated for dependent children younger than 18 years and for children from 18 to 25 years old if the child is in full time education. Child benefits for disabled children cannot be calculated because of the lack of information. Income thresholds for dependent children are also not simulated in EUROMOD.

The amount of child benefits depends on the birth rank of the child. The oldest one gets rank 1, the second oldest gets rank 2 and all the following children get rank 3. If the number of beneficiary children decreases the remaining ones get a lower rank. The second oldest then becomes rank 1, etc.

The simulated supplements to the child allowance include a school premium, age-related supplements and social supplements<sup>1</sup>. The *back to school-premium* is a yearly allowance for children in all schemes. The amount depends on the age of the child. *Age-related supplements* are the same for all schemes as well as for orphan's allowance and guaranteed family allowance. Only for the self-employed scheme there is a difference in that there is no age supplement for the youngest child that gives a right to child benefits nor is there an age supplement for the only child. The *social supplements* are primarily for children of beneficiaries that receive a replacement income: retirement pension, survival pension, unemployment benefits (full-time and longer than six months in unemployment), and disability benefits. There are income conditions that must be met in order to be eligible for social supplements to child benefits.

- *Definitions*

The benefit unit is the nuclear family (*tu\_cb\_be*). The child allowance is paid to the person responsible for the upbringing of the child (in EUROMOD, the head of the tax unit is the default).

- *Eligibility conditions*

There is no additional eligibility rule apart from the presence of dependent children in the family. The actual amounts, however, can differ slightly among the categories of the beneficiaries.

The beneficiary, in general the father, opens is eligible for child allowance if his employer (or himself if he is the self-employed) pays or has paid social security contributions. The relevant rules for the computation of child allowances depend on the contribution scheme to which the employer of the beneficiary or the beneficiary himself contributed (wage earner on the private labour market, wage earner on the public labour market (either statutory or contractual), or the self-employed). The wage earners without statutory service on the public labour market are treated in the same way as wage earners on the private labour market. In case the beneficiary is currently not active on the labour market he/she can be eligible for child allowance if he/she is sick or disabled or inactive due to occupational hazard or disease, or is unemployed, or is a pensioner. If a beneficiary did not contribute to any of the social security contribution schemes he or she may still be eligible for child allowance through the system of guaranteed child allowance. The guaranteed child allowance is means-tested.

---

<sup>1</sup> Supplements for disabled children are not simulated as this information is not available in the data.

From July 2014 the three contribution schemes (for employers, self-employed and civil servants) are unified.

In EUROMOD, the schemes of child allowance for wage earners, child allowance for the self-employed and the guaranteed child allowance are simulated. The scheme of child allowance for wage earners in the public sector is the same as the scheme of child allowance for wage earners in the private sector. From 2014 only two schemes of child allowances are simulated. First, the system for employees, the self-employed and wage earners in the public sector and another system for the guaranteed child allowances.

To be eligible for child allowance in the scheme of wage earners or employees (one of) the parents of the dependent child (has/)have to receive an income from employment, a sickness or disability benefit, an old age pension, a survivor pension, an early retirement pension or an unemployment benefit. To be eligible for child allowance in the scheme of the self-employed (one of) the parents of the dependent child (has/)have to receive an income from self-employment. If a person does not fall in the employer or self-employed system and yet is a parent of dependent child, he or she is eligible for the guaranteed child benefits.

- **Income test**

The guaranteed child allowance is means tested and is for the most destitute families only. To be eligible the own means of the beneficiary and his or her partner (TU: *tu\_cb\_be*) may not exceed limits that are increased by 20% for each child from the second onward. Child benefits, scholarships, maintenance allowances, alimony, army indemnities, rents obtained by non-insured pensioners, allowances from private or public assistance (social assistance) and cadastral income are not included in the means test. The following formula is applied:

$$\text{Base amount} + \text{base amount} * 0.2 * [\text{number of children in the Tax Unit (tu\_cb\_be)}]$$

**Table 7.** Quarterly maximum amounts means test of the guaranteed child allowance

	2012	2013	2014	2015
Base amount ( <i>\$CB_GuaranteedMT</i> )	3983.07	4062.82	4062.82	4062.82

In order to be eligible for social supplements to child benefits, there are also income conditions that must be met. For lone parents with children the total amount of the replacement incomes and incomes from professional activity may not exceed the amounts of the means test depending on the household type.

**Table 8.** Means test for social supplements

	2012	2013	2014	2015
Lone parents ( <i>\$CB_MaxIncSingleParent</i> )	2187	2230.74	2309.58	2338.47
Couples ( <i>\$CB_MaxIncCohabiting</i> )	2261.74	2306.94	2385.65	2414.54

- **Benefit amount**

The actual amount of *child allowance* received is very similar along the different contributory schemes. The amount received per child increases with the rank of the child. This makes the Belgian family benefit scheme pro-natalist. The amounts in Table 6 apply for all schemes. In the scheme of the self-employed, the first-born (rank 1) is eligible to a lower monthly child allowance than in the other

schemes (until 2013). The amounts for children in rank 2 and higher do not change for the self-employed scheme.

Table 9. Amounts of the ordinary child allowance per month

	2012	2013	2014	2015
Rank 1 ( <i>\$CB_BaseAmtEmpCh1</i> ) (oldest child)	€88.51	€90.28	€90.28	€90.28
Rank 1, self-employed ( <i>\$CB_BaseAmtSelfCh1</i> )	€82.78	€84.43	€90.28	€90.28
Rank 2 ( <i>\$CB_BaseAmtEmpCh2</i> )	€163.77	€167.05	€167.05	€167.05
Rank 3 ( <i>\$CB_BaseAmtEmpCh3</i> )	€244.52	€249.41	€249.41	€249.41

The *school premium* is the same for all schemes. The yearly premium increases with the age of the child. Table 7 shows the premium for the different age groups.

Table 10. Amounts of the yearly back to school premium

	2012	2013	2014	2015
0-5 ( <i>\$CB_SchoolAge0to5</i> )	€7.06	€7.60	€7.60	€7.60
6-11 ( <i>\$CB_SchoolAge6to11</i> )	€7.44	€8.59	€8.59	€8.59
12-17 ( <i>\$CB_SchoolAge12to17</i> )	€8.41	€8.02	€8.02	€8.02
18-25 ( <i>\$CB_SchoolAge18to24</i> )	€108.25	€110.42	€110.42	€110.42

*Age-related supplements* are the same for all schemes (as well as allowance for orphans and guaranteed family allowance). Only for the self-employed scheme there is a difference in that there is no age supplement for the youngest child that gives a right to child benefits nor is there an age supplement for the only child. The calculation rules are summarized in Table 11.

Table 11. Amounts of the age-related supplements per month

Date of Birth	Age	Amount of supplement			
<b>first rank</b>		2012	2013	2014	2015
6 to 11 years ( <i>\$CB_SuppChAge6to11a</i> )	6-11	€15.42	€15.73	€15.73	€15.73

- ( <i>\$CB_SuppChAge12to17d</i> )	12-17	€46.98	€47.92	€47.92	€47.92
- ( <i>\$CB_SuppChAge18to24d</i> )	18-24	€59.74	€60.93	€60.93	€60.93

*Social supplements* can be granted according to the social status of the beneficiary of the child benefit. The social supplements are primarily for children of beneficiaries that receive a replacement income: retirement pension, survival pension, unemployment benefits (full-time and longer than six months in

unemployment), and disability benefits. The amounts of the supplements are summarized in Table 12. For the disabled beneficiaries, the amounts differ for the first child. For lone parents social supplement is higher from the third child and following children.

Table 12. Amounts of the social supplements per month

	2012	2013	2014	2015
<b>Rank 1</b> ( <i>\$CB_SocSuppCh1</i> )	€45.06	€45.96	€45.96	€45.96
Disabled employees ( <i>\$CB_SocSuppCh1EmpDisab</i> )	€6.94	€8.88	€8.88	€8.88
<b>Rank 2</b> ( <i>\$CB_SocSuppCh2</i> )	€7.93	€8.49	€8.49	€8.49
<b>Rank 3</b> ( <i>\$CB_SocSuppCh3HH</i> )	€4.90	€	€	€
Lone parent ( <i>\$CB_SocSuppCh3LP</i> )	€45.06	€45.96	€45.96	€45.96
	€2.52	€2.97	€2.97	€2.97

### 2.3.2 Birth allowance (geboortepremie / prime de naissance) (*bchba\_s*)

- *Brief description*

The birth allowance is a universal lump sum benefit to the parents of a new-born baby. The amount only depends on the rank of the child (first-born or not). If the first-borns are twins then the amount for a first-born applies for both. A birth allowance can also be given in case of miscarriage as long as the pregnancy has lasted at least 180 days.

- *Definitions*

The benefit unit is the nuclear family (*tu\_cb\_be*), and the birth allowance is usually assigned to the same beneficiary as the child allowance.

- *Eligibility conditions*

There is no eligibility condition apart from being the parent of a new-born baby. The amounts for the birth allowance are independent of the contribution scheme.

- *Income test*

None.

- *Benefit amount*

Table 13. Birth allowance amounts.

	Amount in euro			
	2012	2013	2014	2015
First born	1,199.10	1223.11	1223.11	1223.11
Following births	902.18	920.25	920.25	920.25

### 2.3.3 Income support (leefloon / revenu d'integration sociale) (*bsa\_s*)

- *Brief description*

If the means of a person are less than a certain threshold, that person is eligible for income support up to the level of the minimum income. In order to receive income support, one needs to apply for it at the offices for public assistance (CPAS). These centers have some discretionary power over the

acceptance. For example, the CPAS can demand an individualized project for social (re)integration that the applicant has to agree to and follow in order to get and/or keep receiving income support. Here we assume full take-up (and acceptance of the application by the CPAS).

- **Definitions**

The benefit unit is the nuclear family – the couple (cohabiting or married) or single adult plus any dependent children. In the social assistance legislation three categories are distinguished:

- category one: applicant living with partner and without dependent family
- category two: single (no partner, no dependents)
- category three: person with dependent family

If the applicant falls under category one, the income of the partner is accounted for in the determination of the income support level for the part that exceeds the income support level. If the applicant falls under category three, all of the partner's income, if there is a partner, is taken into account for the calculation of income support. In this case the right for his/her spouse is automatically covered, i.e. (s)he cannot claim income support, and each spouse/partner gets half of the income support amount.

- **Eligibility conditions**

Income support can be granted to all adults ( $\geq 18$  years) resident in Belgium. It can be extended to minors if they no longer have a legal guardian following a marriage, if they are pregnant, or if they have dependent children. The focus here is on adults from 18 to 62 years (from the age of 63 one becomes eligible for income support to the elderly). To become eligible, one has to apply for income support at the CPAS, which means the benefit is not automatically granted.

- **Income test**

If the means of a person are less than a certain threshold that person is eligible for income support up to the level of the minimum income, i.e. the amount of income support is equal to the minimum subsistence level minus the person's own means. The means include all factual income, not only official income. The income support is for unlimited duration but each year the CPAS will make a re-assessment of the personal situation of the applicant and can withdraw the income support based on the results of that inquiry. It belongs to the discretionary power of the CPAS to do the re-assessment on a more frequent basis. The applicant/beneficiary is bound to provide all the necessary information and to contact the CPAS if something changed in his or her personal (financial) situation.

Own means include the following:

- net occupational income (from employment)<sup>2</sup>
- replacement incomes
- income from real estate: not simulated<sup>3</sup>

---

<sup>2</sup> To encourage employment for social assistance beneficiaries the first three years of employment €200.19 of net occupational income is discarded (not simulated).

<sup>3</sup> Since we do not have information on cadastral income yet the calculation of income from real estate will be switched off. Normally, the calculation for income from real estate is the following: non-indexed cadastral income with an exemption of €750 plus €125 per dependent child (=child that gives right to child benefits). The result is then multiplied by 3 and taken into account in the means test. In case the property is rented one takes the rent received unless this should be less than the amount obtained when using the cadastral income. As social assistance is an individual right the income from real estate will be multiplied by the fraction representing the ownership of the person in the property (in case of shared ownership).

- income from equity: the first €6,200 of (financial) capital is not taken into account. For the part between €6,200 and €12,500, 6% is taken as income from capital and for the amount higher than €12,500 10% is taken into account as income from capital<sup>4</sup>.

The following income components are not taken into account:

- benefits in-kind (such as meals)
- social assistance
- child benefits
- alimony for children
- study grants
- refundable tax credit for children

- **Benefit amount**

Table 14. Base amounts for income support per month

	2012	2013	2014	2015
Category 1	523.74	534.23	544.91	544.91
Category 2	785.61	801.34	817.36	817.36
Category 3	1,047.48	1068.45	1089.82	1089.82

Table 15. Disregarded amounts for income support per month

	2012	2013	2014	2015
Category 1	155	155	155	155
Category 2	250	250	250	250
Category 3	310	310	310	310

If eligible after all calculations the final amount is equal to the base amount minus own income.

- **Treatment of the simulated income support in EUROMOD**

In the baseline system **the simulated amounts of income support with take-up correction are included in the disposable income concept** rather than the amounts recorded in the EU-SILC. We adjust for the non take up of benefits with a simple random **non take-up correction** by applying the take-up proportion estimated as the ratio between the caseload recipients reported by the Official Statistics and those simulated to be entitled by EUROMOD. Once the simulated benefit is switched on in the spine, the correction for non take up is, by default, switched on as well. To switch the take-up correction off, a user needs to switch off the relevant policy sheet (TakeUp\_be) in the spine. The take-up probability mentioned above is defined in the relevant policy sheet at the end of the simulation. A user can change these probabilities or switch off the take-up correction.

However, the non take-up correction is still very rough and does not satisfactorily reflect the real take-up issues playing (large discretionary power of the CPAS, detailed means-test). The refinement of this is one of our planned further developments.

### 2.3.4 Income support for the elderly (inkomensgarantie voor ouderen / la garantie de revenus aux personnes âgées) (bsaoa\_s)

<sup>4</sup> Income stemming from the sale or donation of propert(y)(ies) within a period of 10 years preceding the application for social assistance. The same schedule applies as for income from capital. This is not simulated due to lacking information.

- **Brief description**

Income support for the elderly is designed in the same way as the regular income support, but available for persons aged 63 or over. The categories are different than in the regular income support, as are the amounts.

- **Definitions**

There is a distinction between persons living alone and those living with others at the same address (presumably couples). In fact a person without a partner but living with (a) minor child(ren) or adult child(ren) for whom child benefits are received and/or relatives (descendants) is considered as living alone and is eligible to receive the increased amount. Income support for the elderly is an individual right whether they are married or not.

- **Eligibility conditions**

All persons aged 63 or above are eligible to receive income support for the elderly.

- **Income test**

Income on the benefit unit level (tu\_oa\_be) is taken into account as follows:

- 75% of gross employment income other than self-employment income
- gross income from self-employment minus incurred expenses (we assume expenses to be 5% as is the case for the lump sum expenses in the personal income tax)
- Income from capital. Similar rules apply as for income support: €6,200 exempted, from €6,200 to €18,600 4% considered as income and above €18,600 10% considered as income from capital
- Income from real estate<sup>5</sup>
- pension income minus paid alimony and the result accounted for at 90%

Not counted are:

- income support
- alimony received

As the income support is an individual right, in the calculation of the benefit amount (for the individual) the income used in the means-test will be divided by the number of persons in the benefit unit.

- **Benefit amount**

Table 16. Base amounts for income support for the elderly, per person per year

	2012	2013	2014	2015
Living alone	11,439.6	11,668.68	12,140.34	12,140.34
Living with partner	7,626.36	7,779.12	8093.56	8093.56

<sup>5</sup> Non-indexed cadastral income, with an exemption of €743.68 plus €123.95 per dependent child (=eligible for child allowance) (amounts remain constant over 2009-2013). The result is multiplied by 3 to get the income from real estate. If the property is rented the rent is taken into account, unless this should be less than the amount when cadastral income is taken. The resulting amount is multiplied by the part the person has in the property in case of shared ownership.

Table 17. Disregarded amounts in the income assessment for income support for the elderly, per person per year

	2012	2013	2014	2015
Living alone	1,000	1,000	1,000	1,000
Living with partner	625	625	625	625

The resulting income support is the base amount minus the income of the applicant.

- ***Treatment of the simulated income support for the elderly in EUROMOD***

The simulation of the income support for the elderly is implemented in the system but it is switched off in the baseline system and it is not included in the simulated disposable income.

As will be discussed in Section 3, it is unclear whether in the SILC survey this benefit was mistakenly recorded as regular pension income in the majority of the cases and is as such already included in the data. This hinders a correct interpretation of the simulated values.

### 2.3.5 Unemployment benefits (werkloosheidsuitkering / allocation de chômage) (*bun\_s; byr\_s*)

- ***Brief description***

In the employment legislation one can distinguish three main groups (see section 1.3.B): the indemnified unemployed, support for employed people, and support for the employed who reduce their working hours. The group of the unemployed includes the unemployed after employment, the unemployed after finishing studies, the older unemployed and the early retired. The unemployment benefits are simulated only for the first group (also the most important group in terms of size) and to a limited extent. The unemployment benefits are implemented following the EUROMOD modeling conventions. Due to the limitations of the input data, the simulated unemployment benefits can only be used to calculate replacements rates.

From 2013 onwards, the *unemployment benefits become more dependent on the time that is spent in unemployment and one's work history before becoming unemployed. Benefits during the first three months are increased, and are thereafter decreased more rapidly over time. This results in a complex bracket system with more than 60 categories, making the amount of benefit received closely dependent on the time spent in unemployment and previous work history.*

- ***Definitions***

Unemployed are subdivided into three categories according to household situation: 1) unemployed with dependent family; 2) singles; and 3) unemployed living with a partner (but without dependents).

To determine whether a person is dependent or not one has to look at the earnings of this person. Reported amounts reported are for 2011.

Earnings from a professional activity of the partner are not taken into account if they do not exceed €750.94 net per month and stem from employment as wage earner. This implies that any self-employment income by the partner excludes the latter from the number of dependents, i.e. the unemployed will not be categorized as an unemployed with dependent family.

Pension benefits or benefits following industrial accidents or work-related illness are not taken into account as long as they do not exceed the maximum level per month.

Other benefits, such as unemployment benefits and sickness and disability benefits other than industrial accidents or work-related illness, are always taken into account to determine whether the partner is dependent or not. It means that the partner receiving unemployment benefits is not considered as dependent.

If the unemployed does not have a partner but lives with children then the income of a child (professional activities, unemployment benefits, and pensions, sickness or disability benefits) is not taken into account if it does not exceed €394.25, the threshold for a child to remain “dependent”.

If besides living with one or more children the unemployed also lives with relatives up to the third degree, ascendants are considered dependent if their income does not exceed the threshold for dependent family.

- ***Eligibility conditions***

### **Unemployment benefits after employment (general case)**

To be eligible to receive unemployment benefits an inactive person has to be in search of work. The unemployed person has to be involuntarily unemployed and without wages whatsoever. He or she has to be available for the labour market and has to be and remain registered as a person in search of work. Furthermore, the unemployed has to reside in Belgium, be fit for work, and has to meet age conditions.

### **Unemployment benefits after studies**

To be entitled to unemployment benefits following graduation, students must prove a period of inactivity depending on their age. This period is called the “waiting period”. The system was reformed in 2012 and renamed into “professional integration time”. The number of days according to age is as follows:

**Table 18.** *Waiting period according to age [2012]*

<i>Younger than 18</i>	<i>155 days</i>
<i>Between 18 and 26</i>	<i>233 days</i>
<i>Between 26 and 30</i>	<i>310 days</i>

**Table 19.** *Professional integration time (beroepsinschakelingstijd/stage d'insertion professionnelle) [2012-2015]*

<i>Younger than 30</i>	<i>310 days</i>
------------------------	-----------------

### ***Unemployment benefits for older employees (werkloosheids met anciënniteitstoeslag/ chômage avec d'ancienneté)***

The older unemployed, aged 50 or more who have had an active career of at least 20 years and who are unemployed for at least one year, are entitled to a seniority supplement.

### **Early retirement benefit**

To be eligible for early retirement benefits the following conditions must be met:

- employee has to be fired by employer
- employee must be entitled to an additional supplement, paid by the employer or some specific fund, on the basis of a collective labour agreement
- employee must be eligible for regular unemployment benefits
- employee must be at least 58 years old
- employee must have had an active career of at least 25 years (as wage earner)

To be eligible for part-time early retirement benefits the employee has to be at least 55 years old, with a career of at least 25 years, of which the last 12 months have to be with the current employer.

- **Benefit amount**

Within the group of the cohabitating unemployed there is a further distinction between those with a partner and those with a “privileged” partner. The latter is a person that has as their sole source of income unemployment benefits that do not exceed a certain thresholds. The distinction between a privileged partner and a partner is only relevant after the first year of unemployment.

The unemployment benefits for the unemployed are as follows:

**Table 20.** Calculation table for unemployment benefits for the unemployed [2012-2015]

	Benefit per day			
	2012	2013	2014	2015
Unemployed with dependent family	€10.88	€11.70	€12.53	€12.53
Single unemployed				
Younger than 18	€1.62	€1.85	€2.09	€2.09
18 or older but younger than 21	€8.25	€8.62	€8.99	€8.99
21 or older	€0.23	€0.84	€1.46	€1.46
Cohabitating unemployed				
Not cohabitating with privileged partner				
Younger than 18	€0.86	€10.05	€10.25	€10.25
18 or older	€15.73	€16.05	€16.36	€16.36
Cohabitating with privileged partner				
Younger than 18	€10.44	€10.65	€10.86	€10.86
18 or older	€16.77	€17.10	€17.44	€17.44

### Unemployment benefits after employment

For unemployed after a period of employment the unemployment benefit depends on household characteristics, as for the young unemployed (after studies), and on past labour market histories. In principle, benefits for the unemployed after a period of employment are based on their (lost) wages. By applying the applicable percentage rule on the (lost) wage, the amount of the unemployment benefit is obtained. In the majority of cases, limitations apply so that the unemployment benefit varies between a maximum and a minimum level.

The percentages and lower and upper limits for unemployment benefits after a period of employment are given in the table below. If not all conditions of previous earnings are fulfilled, the unemployment benefit is calculated using the reference wage of 1,443.54 (in 2011). Wages are only taken into account until a maximum wage (cfr. Table 18)

**Table 21.** Wage ceilings for unemployment benefits [2012]

	Period	Maximum Monthly amount
Highest wage ceiling	1 <sup>st</sup> to 6 <sup>th</sup> month	€2,370.76
Middle wage ceiling	7 <sup>th</sup> to 12 <sup>th</sup> month	€2,209.59
Lowest wage ceiling	From 13 <sup>th</sup> month if cohabitants or dependent persons	€2,064.81
Specific wage ceiling	From 13 <sup>th</sup> month if single unemployed	€2,019.88

Table 9 shows the rules for calculating the amount of unemployment benefits.

**Table 22.** Calculation table for unemployment benefits after employment [2012]

	Percentage rule	Minimum amount
Unemployed with dependent family		€40.31
0-6 months	60%	
6-12 months	60%	
13-15 months	60%	
Last period	60%	
Single unemployed		€35.24
0-6 months	60%	
6-12 months	60%	
13-15 months	55%	
Last period	55%	
Cohabiting unemployed		€26.42
0-6 months	60%	
6-12 months	60%	
13-15 months	40%	
Last period	€484/month	

### Unemployment benefits older unemployed

The table below shows the “rule” used to determine the seniority supplement and the minimum and maximum daily amounts of the total benefits, i.e. regular + supplement. These amounts are for 2012.

**Table 23.** Calculation table for unemployment benefits for the older unemployed [2012]

	Percentage rule	Minimum daily amount (base amount + supplement)	Maximum daily amount (base benefit + supplement)
Unemployed with dependent family	60% +	€43.97	€51.64
Single unemployed			
55 years or older	60%	€40.43	€47.06
All other cases	55.8%	€36.79	€43.77
Cohabiting unemployed			
First 15 months of unemployment			
55 or older, younger than 58	50%	€33.30	€39.22
58 years or older	55%	€36.60	€43.14
All other cases	45%	€29.88	€35.30

### Early retirement benefits

- **Conventional early retirement**

The early retirement benefit paid by the unemployment office is a percentage of lost but limited wages (ALDW). The benefits are calculated as follows (amounts for 2011):

**Table 24.** Calculation table for conventional early retirement benefits [2012]

	Rule	Minimum	Maximum
Early retirement benefits	60% of ALDW	€1.95 per day	€4.71 per day

The minimum legally required amount of the additional benefit to be paid by the employer is equal to half the difference between the net wages and the unemployment benefit. Net wages are gross wages minus social security contributions and withholding tax.

- ***Simulation of Unemployment Benefits in EUROMOD***

Unemployment benefits after employment are parameterized in EUROMOD but they are switched to *toggle* in the baseline. In order to simulate the unemployment benefits (mainly to calculate replacement rates), some additional variables are included in EUROMOD:

Lnu:	a dummy variable for new unemployed
liwmy_a:	number of months in work in the year preceding unemployment (for new unemployed)
yempv_a:	monthly gross wage in the year preceding unemployment (for new unemployed)
yem_a:	monthly gross wage for new employed (previously yem00)
lhw_a:	average weekly working hours for new employed (previously lhw00)

Such implementation is thought to simulate unemployment benefits for individuals observed in work (i.e. with positive earnings) and it is not intended to replace the recorded unemployment benefits (i.e. bun) of individuals observed in unemployment (i.e. without earnings, necessary to simulate the unemployment benefits). As a consequence, the variable bun should not be modified.

The simulated unemployment benefits are recorded in the variable bun\_s. This variable is already included in the relevant income lists (e.g. taxable income). The variable bun\_s is initialized as equal to 0 in the policy *InitVars\_be* in order to avoid any warning message when the policy *bun\_be* is switched off/toggle.

Because this simulation exercise serves the specific purpose of simulating the unemployment benefit in a hypothetical scenario it cannot serve to replace the recorded unemployment variable, and the variable bun\_s cannot be macrovalidated with external statistics. The variable bun\_s can only be simulated for the first year of unemployment.

As said, the above applies to the unemployment benefit system from 2012 to 2015.

## 2.4 Social contributions

### 2.4.1 Employee social contributions and employer social contributions (*tscee\_s*, *tscer\_s*)

- ***Wage earners on the private labour market***

First the percentages will be listed for regular social insurance contributions. In some cases social insurance contributions can be reduced. The reductions will be treated in a later section.

#### **Social insurance contributions before deductions**

In total, social insurance contributions amount to 13.07% of the gross wage for employees, and from 33% to 40.73% of the gross wage for the employers, dependent on the size of the firm and whether the employee is a blue or a white collar worker. For instance, blue collar workers don't pay social insurance contributions on their single holiday earnings (corresponding to 8% of their annual wages), but on their regular earnings, they pay social insurance contributions on 108% of their wage. Employees are eligible for a reduction in social insurance contributions, called "work bonus", if they satisfy certain income conditions.

In total, social insurance contributions amount to 13.07% of the gross wage for employees, and to 33% to 40.73% of the gross wage for the employers, dependent on the size of the firm and whether the employee is a blue or white collar worker. For instance, blue collar workers don't pay social insurance contributions on their single holiday earnings (corresponding to 8% of their yearly wage), but on their regular earnings, pay social insurance contributions on 108% of their wage. Employees are eligible for a reduction in social insurance contributions, called "workbonus", if they satisfy certain income conditions.

The applicable percentages for the different components of social insurance for wage earners (including wage earners on the public labour market without statutory service) are listed in Table 22.

Table 25. Employee and employer social insurance contribution for wage earners on the private labour market [2012-2015]

	blue collar workers % of gross earnings at 108%			white collar workers % of gross earnings		
	employee	employer	total	employee	employer	total
<b>General contributions</b>						
Pensions	7.50	8.86	16.36	7.50	8.86	16.36
Sickness and disability						
Medical care	3.55	3.80	7.35	3.55	3.80	7.35
Disability benefits	1.15	2.35	3.50	1.15	2.35	3.50
Unemployment	0.87	1.46	2.33	0.87	1.46	2.33
Family benefits		7.00	7.00		7.00	7.00
Accidents at work		0.30	0.30		0.30	0.30
Work-related illness/disease		1.02	1.02		1.02	1.02
Annual vacation		6.00	6.00			
Educational leave		0.06	0.06		0.06	0.06
Work integration/guidance programs for youth		0.05	0.05		0.05	0.05
Childcare		0.05	0.05		0.05	0.05
(Re)employment of vulnerable groups		0.10	0.10		0.10	0.10
Wage moderation		7.48	7.48		7.48	7.48
Contribution unemployment						
10 employees or more		1.60	1.60		1.60	1.60
Wage moderation		0.09	0.09		0.09	0.09
<b>Company closing</b>						
1 to 19 employees: general		0.09	0.09		0.09	0.09
1 to 19 employees: wage moderation		0.01	0.01		0.01	0.01
20 or more employees: general		0.10	0.10		0.10	0.10
20 or more employees: wage moderation		0.01	0.01		0.01	0.01
Temporary unemployment		0.14	0.14		0.14	0.14
Wage moderation		0.01	0.01		0.01	0.01
<b>Global total</b>						
1 to 9 employees	13.07	38.07	51.84	13.07	32.77	45.84
10 to 19 employees	13.07	40.46	53.53	13.07	34.46	47.53
20 or more employees	13.07	40.47	53.54	13.07	34.47	47.54

Single holiday earnings for civil servants are equal to the wage that would have been earned when not on holiday and the double holiday earnings consist of a lump sum amount and a variable part in percent of gross annual earnings.<sup>6</sup>

For white collar workers the percentages are applied on gross earnings received while working and on gross single holiday earnings. For blue collar workers the percentages are applied on 108% of their gross remunerations while working (and not on holiday earnings). In the case of blue collar workers single and double holiday earnings are not part of the remuneration concept on which social insurance contributions are levied. White and blue collar workers also have to pay social insurance contributions on their double holiday earnings. For white collar workers this is 13.07%; blue collar workers also have to pay 13.07% and the calculation base is 6.80% of 108% of gross earnings in the year preceding the year of the holiday.

<sup>6</sup> The percentage of the variable part is linked to the evolution of the consumer price index that determines the gross wage due in March of the year of holiday.

As the single holiday earnings of blue-collar workers consist of 8% of the gross wage, total social insurance contributions amount to the same as if 13.07% on 100% of total earnings were levied. Because it is impossible to distinguish holiday earnings from the data, this is the way it is simulated in EUROMOD.

An additional 10.27% on 108% of annual earnings<sup>7</sup> of the previous year is due by employers for blue collar workers to finance holiday earnings.<sup>8</sup>

### **Deductions on social insurance contributions**

#### Employers' deductions

Employers can enjoy a structural deduction of social insurance contributions as a measure to stimulate employment. The structural deduction is applicable for all workers that are subject to all branches of social insurance. In reality this means that the structural deduction is for employers in the private sector only. The basic structural deduction amounts to €400 per quarter for each full time worker.<sup>9</sup> This amount is increased for low income workers and high income workers according to the following scheme:

**Table 26. Employers' deductions in social insurance contributions [2012]**

<b>Earnings in euro per quarter (I)</b>	
Less than €5,870.71	$400 + 0.162 * (5870.71 - I)$
More than €12,240	$400 + 0.06 * (I - 12240)$

Besides the structural deduction there are several specific target-group reductions that aim to increase the employability of certain more vulnerable groups (not simulated). The structural deduction can be combined with only one target-group reduction.

### **Employees social insurance reductions**

Employees are eligible for a reduction in social insurance contributions, called “workbonus”, if they satisfy certain income conditions. The income used in the means-test is based on full-time equivalent income and requires a distinction between the labour time expressed in days and the labour time expressed in hours and minutes. The full-time equivalent income (FTE) is calculated as follows:

**Table 27. Determination of the full-time equivalent income concept [2012-2015]**

Labour time measured in days	$FTE = \text{gross earnings} * [ (\text{number of days per month corresponding to full-time position}) / (\text{number of days per month actually worked}) ]$
Labour time measured in hours	$FTE = \text{gross earnings} * [ (\text{number of hours per month corresponding to full-time position}) / (\text{number of hours per month actually worked}) ]$

---

<sup>7</sup> Again, 108% is on annual earnings exclusive of holiday earnings. In the implementation, 100% is used, as the employment income variable includes holiday earnings.

<sup>8</sup> Because in EUROMOD we only dispose of the earnings of the current income year, it is assumed that earnings have remained the same as the preceding year in order to calculate these contributions.

<sup>9</sup> The lump sum reduction of €400 is not applicable to employers in the non-profit sector as they enjoy other reductions (not simulated).

The basic reduction is then calculated according to the following rules:

Table 28. Employee social insurance reduction (“workbonus”) [2012-2015]

Full-time equivalent income per month - bracket amounts for 2015	Monthly amount of reduction in euro			
	2012	2013	2014	2015
<=1546.87	175	183.97	183.97	183.97
>1546.87 and <=2413.00	175 - 0.2743 * (FTE-1472.40)	184-0.2082 * [FTE-1501.83]	183.97-0.2082 * [FTE-1501.83]	183.97-0.2082 * [FTE-1501.83]
>2413.00	143 - 0.1651 * (FTE-1797.13)	n.a.	n.a.	n.a.

The actual reduction is calculated by taking the basic reduction and multiplying it by the fraction of the actual number of hours or days worked (variable lhw) to the corresponding number for a full-time position (38 hours per week). If the number of hours worked per week is more than 38 than we just take a ratio of 1, i.e. working full-time. For a full-time employee the workbonus is equal to the basic amount. For employees that work less than full-time the amount of the workbonus is calculated in a similar manner as the full-time equivalent income but with the fraction reversed. The rules are the same for white and blue collar workers.

- *civil servants*

Social insurance contributions for wage earners on the public labour market without statutory service are the same as those for wage earners on the private labour market. The only exception is that wage earners on the public labour market without statutory service do not have to pay contributions for company closure (company closure fund).

In principle the (public) employer of wage earners in the public sector without statutory service enjoys the same deductions as private employers if the employees are subject to all branches of social insurance (where required).

The social insurance contributions for civil servants with statutory service are different than those for wage earners. Moreover, there is a difference for civil servants working for the federal government and those working for local and provincial administrations<sup>10</sup>. Because the data did not allow making the distinction, all contributions of civil servants are simulated according to the federal level scheme:

<sup>10</sup> The percentages for employees of local or provincial administrations are as follows

Type of contribution	Employee (% of gross earnings)	Employer (% of gross earnings)
Pensions	7.50	20.00
Sickness and disability benefits	3.55	3.80
Family benefits		5.25
Work-related illness		0.17
Wage moderation		7.48
Childcare		0.05

Table 29. Social insurance contributions for civil servants at the federal level [2012-2015]

Type of contribution	Employee (% of gross earnings)	Employer (% of gross earnings)
Survival pensions	7.50	
Sickness and disability benefits	3.55	3.80

### Reductions in employers' social insurance contributions

Also for employers in the public sector at local or provincial level programs exist that give right to a reduction in social insurance contributions.

### Reductions in employees' social insurance contributions

Certain low wage civil servants of local and provincial administration might be eligible for a reduction of personal social insurance contributions if the monthly wage does not exceed a certain amount (not simulated).

## 2.4.2 Special social security contributions (*tsceesp\_s*)

After calculation of taxes due there is also a special contribution for social security that we mention separately since it is applied after taxes and hence does not influence net taxable income. This contribution is withheld each month and shown on the payslip. The final amount, however, is calculated on (fiscal) household level (*tu\_couple\_be*) and is settled together with the final personal income tax. The special contribution is due by all employees subject to the social insurance scheme for wage earners.<sup>11</sup>

The final settlement – as it is implemented in EUROMOD baseline – will be calculated according to the following schedule:

Table 30. Special social insurance contribution (final settlement) [2012-2015]

Gross net taxable household income (I)	Yearly in euro
<=18592.02	0
>18592.02 and <=21070.96	0.09*(I-18592.02)
>21070.96 and <=60161.85	223.10+0.013*(I-21070.96)
>60161.85	731.28

<sup>11</sup> The monthly withheld amounts are as follows [2012-2015]:

Gross monthly earnings in € (at 108% for blue collar workers) (I)	Single or spouse without income from professional activity (monthly amount in €)	Spouse with income from professional activity (monthly amount in €)
<1095.10	0	0
>=1095.10 and <1945.39	0	9.30
>=1945.39 and <2190.19	0.076*(I-1945.39) with a max. of 18.60	0.076*(I-1945.39) with a min. of 9.30 and a max. of 18.60
>=2180.19 and <6038.83	18.60+0.011*(I-2180.19)	18.60+0.011*(I-2180.19) with a max. of 51.64
>=6038.83	60.94	51.64

### 2.4.3 The self-employed social contributions (*tscese\_s*)

The self-employed pay social insurance contributions on a quarterly basis based on their income in the third calendar year preceding the year of contribution. If the self-employed has not yet been active for three years a lump sum amount of contributions is levied<sup>12</sup> which will be regulated later against real earned income. As the EUROMOD data contain annual income information of one year, it is assumed that the income has remained similar, so social insurance contributions are calculated on the income of the current year.

If the spouse of the self-employed works as his/her assistant there are two possibilities: he or she opts for a “maxi-statute” or a “mini-statute”. In the former case the normal rules to calculate social insurance contributions apply. In the latter case the social insurance contributions are calculated differently, but this is not simulated.

The self-employed, besides paying the contributions according to the rules set out above, also have to participate in the working costs of the social insurance funds to which they are affiliated. The percentages range between 3.5% and 4.7% on the contribution amounts (not simulated).

#### Calculation of social insurance contributions of the self-employed

The basis of calculation is net indexed earnings, i.e. gross earnings net of professional costs and possible losses. The consumer price index is used for indexation.

#### The self-employed in main activity before retirement age

Table 31. Calculation structure of the social insurance contributions for the self-employed in main activity before retirement age [2012]

Annual net indexed earnings (I)	Annual social insurance contribution
$\leq \text{€}4,398.06$	$\max\{2,771.44, 0.22 \cdot I\}$
$> \text{€}4,398.06$ and $\leq \text{€}80,168.52$	$13,094.63 + 0.1416 \cdot (I - 52,378.55)$

The structure of the calculation is similar in the other years, only the amounts are indexed. The applicable amounts for 2010-2014 can be found in the EUROMOD policy sheet *tscese\_be*. Minimum and maximum amounts for the contributions apply:

Table 32. Parameters for the social insurance contributions for the self-employed in main activity before retirement

	2012	2013	2014	2015
Minimum contribution per year	€2,771.44	€2,822.72	€2,943.32	€2,943.32
Maximum contribution per quarter	€3,904.06	€3,976.33	€4,110.32	€4,110.32

#### The self-employed in complementary activity before retirement age

When the self-employed activity is not the main activity of the individual social insurance contributions are set differently. If net earnings in the third calendar year preceding the year of contribution are less than the threshold (cf. Table 33), no social insurance contributions are due. If net earnings exceed the threshold, the same schedule applies as for self-employment as main activity (with a different minimum contribution).

<sup>12</sup> Not simulated.

Table 33. Social insurance contributions for the self-employed in complementary activity before retirement age

	2012	2013	2014	2015
Yearly income threshold below which no contributions are due	€1,393.70	€1,419.5	€1,423.90	€1,423.90
Minimum contribution per quarter (>threshold)	€76.65	€78.07	€81.40	€81.40
Maximum contribution per quarter	€3,904.06	€3,976.33	€4,146.22	€4,146.22

### The self-employed activity in combination with pension benefits

For individuals that receive pension benefits rules exist about the combination of those benefits with self-employment<sup>13</sup>. The social insurance contributions that are due on the net earnings from self-employment are as follows:

Table 34. Social insurance contributions for the self-employed activity in combination with pension benefits

	2012	2013	2014	2015
Yearly income threshold below which no contributions are due	€2,787.40	€2,839.00	€2,847.81	€2,847.81
Contribution rate for >threshold	14.7%	14.7%	14.7%	14.7%
Minimum contribution per quarter	€102.44	€104.33	€108.79	€108.79
Maximum contribution per quarter	€766.61	€781.94	€828.74	€828.74

### The self-employed after retirement age but without retirement pension benefits

The social insurance contributions on the earnings of individuals who are self-employed after retirement age and without receiving pension benefits largely follows the same calculation scheme as the self-employed in main activity before retirement age (two-bracketed structure in Table 31), however a minimum threshold applies (below which no contributions are due) and if income exceeds this threshold, the minimum contribution that is due is also different.

Table 35. Parameters of the social insurance contributions for the self-employed after

<sup>13</sup> If the following conditions are satisfied the pension benefits are paid out in full, i.e. they receive their pension benefits as if they had no other earnings from a paid activity. These amounts are for 2012.

Age and type of pension	Maximum income from self-employed activity without losing pension benefit
65 year or older	€7,149.19 (without dependent children) €20,859.98 (with dependent children)
Less than 65, one or more survival pensions	€3,824.00 (without dependent children) €17,280.00 (with dependent children)
Less than 65, retirement or retirement and survival pension	€5,937.26 (without dependent children) €8,905.89 (with dependent children)

Source: RSVZ 2012

If the above amounts are violated by more than 15% the entire pension benefit is lost. If the above amounts are violated by less than 15% the pension benefits are decreased at the rate at which they exceed the income threshold conditions.

## retirement age without pension benefits

	2012	2013	2014	2015
Yearly income threshold below which no contributions are due	€2,787.40	€2,839.00	€2,847.81	€2,847.81
Minimum contribution per quarter (if I>threshold)	€153.31	€156.15	€162.82	€162.82
Maximum contribution per quarter	€3,904.06	€3,976.33	€4,110.32	€4,110.32

**2.4.4 Social insurance contributions paid on non-labour income (*tspe\_s*)**
**Retirement and survival pensions**

Retirement and survival pension benefits are subject to a social insurance contribution of 3.55% for the funding of sickness and disability insurance. However, if the contribution would bring the pension amount below a certain threshold, contributions are limited to the amount exceeding the threshold. Although strictly speaking an unemployment benefit, the treatment of early retirement pensions concerning social insurance contributions is more similar to that on pensions. On the one hand, a social insurance contribution of 3.5% is withheld by the employer on the part paid by the employer to fund pension insurance. On the other hand, a contribution of 1% to 3%, depending on the start date of the early retirement, is withheld by the unemployment office for financing the unemployment benefit.

**Table 36.** Monthly thresholds for social insurance contributions for retirement and survival pensions

	2012	2013	2014	2015
Pensioner without dependent family	€1358.92	€1413.84	€1413.84	€1413.84
Pensioner with dependent family	€1407.16	€1464.03	€1464.03	€1464.03

A second contribution (solidarity contribution) is withheld for pensions that exceed €2,518.75 for pensioners with dependent family (i.e. children) and €2,178.61 for pensioners without dependent family in 2012. This solidarity contribution is aimed at increasing solidarity among pensioners and is specifically used to protect and preserve minimum pensions. The rate progressively increases from 0.5% to 2%. If the pension benefit exceeds €2,805.71 (€2,455) for pensioners with (without) dependent family the contribution percentage is 2%. These last amounts are for 2012.

**Table 37.** Calculation of social insurance contributions for pensioners & survival pensioners [2012]

Without dependent family		With dependent family	
Pension amount in euro per month (P)	Contribution	Pension amount in euro per month (P)	Contribution
0.01-2,178.61	0	0.01-2,518.75	0
2,178.61-2,245.99	$(P-2,178.61)*0.5$	2,518.75-2,596.64	$(P-2,518.75)*0.5$
2,245.99-2,429.73	$P*0.015$	2,596.64-2,776.84	$P*0.015$
2,429.73-2,455	$36.45+(P-2,429.73)*0.5$	2,776.84-2,805.71	$41.65+(P-2,776.84)*0.5$
$\geq 2,455$	$P*0.02$	$\geq 2,805.71$	$P*0.02$

**Social insurance contributions on conventional early retirement benefits<sup>14</sup>**

<sup>14</sup> This is not simulated as it cannot be derived from the data which part is attributable to the employer and which part to the unemployment office as the rates differ.

An employee has a right to a conventional early retirement if he or she is 58 years old with at least 25 years of professional activity. Part of the conventional early retirement is paid by the unemployment office and part is paid by the employer.

A social insurance contribution of 3.5% is withheld by the employer on the part paid by the employer to fund pension insurance and a contribution of 1% or 3%, depending on the start date of the early retirement, is withheld by the unemployment office on the unemployment benefit. The 1% is for those whose early retirement started before 1997 and the 3% for those who retired early after 1997. For early retired, the pension cannot fall below certain thresholds, which depend on the presence of dependent family. If it does, no contributions are due.

**Social insurance contributions on disability benefits**

On disability benefits received by wage earners a social insurance contribution of 3.5% is levied to fund the pension insurance scheme. Again the payment of such contribution may not have as a consequence that the benefits fall below a certain threshold. The threshold for beneficiaries with dependent family are summarized in Table 38. Contributions are not due on benefits for primary disablement (first year).

**Table 38. Social insurance contributions on disability benefits**

Daily thresholds for:	2012	2013	2014	2015
Beneficiary without dependent family	€46.69	€47.63	€48.85	€48.85
Beneficiary with dependent family	€56.24	€57.37	€58.52	€58.52

**Social insurance contributions on benefits for work-related sickness and disease and occupational injuries**

The percentage applicable is 13.07% on benefits for either permanent or temporary disablement but no contribution is due on benefits for assistance by a third person. Because in the data, it is not possible to distinguish work-related sickness and disease and occupational injuries from regular sickness- and disability-benefits, all sickness and disability benefits are treated as the regular category (see paragraph above). Thus, the social insurance contributions on occupational injuries and work-related sickness and disease are not implemented.

**2.4.5 Flemish care insurance contribution (tci\_s)**

The Flemish Care Insurance provides a support measure for people with care needs to cover part or full costs of non-medical care. Starting from October 2001 anyone over the age of 25 and living in Flanders is required to pay an annual fee to a healthcare fund. For people living in Brussels membership is voluntary. People can submit an application to their healthcare fund if they think they qualify for the Flemish care insurance system. The cost coverage from the Flemish health insurance is paid on a lump sum basis.

**Table 39. Annual Flemish care insurance contribution**

	2012	2013	2014	2015
Member contribution	€5	€5	€5	€0
Member contribution if eligible for a higher compensation (pensioners, widows, orphan, etc.)	€10	€10	€10	€25

## 2.5 Withholding income tax (*tinwh\_s*)

- **Brief description**

The withholding income tax is a system of advance payments, each time one's salary or allowance is paid (mostly monthly, but also weekly or two-weekly is possible).<sup>15</sup> It seeks to approximate the final personal income taxes due. The rough lines of the calculation of the withholding tax are similar to the calculation of the personal income tax, however, it only takes into account the most important elements, and is in that way much less detailed, so differences can be considerable. A clearance of the balance between withholding tax (already paid) and final income taxes due (calculated on the basis of the filed tax returns which are due by the end of June of the year after the income reference year) usually takes place in the first half of the second year after the period in which the income has been received.

After subtracting social insurance contributions and (fixed) professional expenses in the case of employment income, the calculation of the withholding tax takes the following elements into account:

- Number of dependent children and persons
- Family situation: standard rates apply for single persons or couples (married or with cohabitation contract) in which both partners receive income. Differently, a deduction mechanism applies for couples in which only one of the partners receives income (to adjust for the 'marital quotient' that applies in the personal income tax system (cfr. paragraph 2.6.5).
- The type of payment (regular (recurrent) versus exceptional (non-recurrent)). The grade of detail of the available data prevents distinguishing between regular and exceptional payments, therefore, all income is treated as regular.

- **Tax base, schedule and allowances**

The basis for the calculation of the withholding tax is the reference income for one year. It is assumed that the present income is being received for one year.

First, social insurance contributions are being deducted from the gross income. For the determination of the amount, see section 2.4.

For the determination of the amount to be deducted as professional expenses, see "deductions related to expenses" under paragraph 2.6.3.

After these two deductions, the schedule in Table 40 is applied to the resulting tax base (the reference net taxable yearly income). This schedule counts for both single persons, and fiscal couples (= married or consensual union with a legal basis) of which both partners receive income (employment income, pensions or other replacement incomes).

**Table 40. Withholding tax schedule [band limits for 2015]**

Net taxable yearly income band	% applied on band
0 - 8,720	26.75
8,720 - 11,840	32.10
11,840 - 17,160	42.80
17,160 - 37,890	48.15
37,890 and more	53.50

<sup>15</sup> Strictly speaking, self-employment income is treated differently, with prepayments on a quarterly basis. However, as we cannot simulate this complex system, all income is treated as regular income.

For fiscal couples where only one spouse receives income higher than the above threshold, a specific mechanism applies. 30% of the net taxable yearly income of the earning spouse is first transferred to the other spouse, with the maximum limits in Table 46. This split part of the income is then treated as the net taxable yearly income of the non-earning spouse, and the above (individual) schedule is then applied to both parts of the income as if it were two separately gained incomes. This mechanism is entirely parallel to the marital quotient system in the personal income taxation (cfr. paragraph 2.6.4)

Next, a number of allowances are deducted from the resulting tax sum. First, a lump-sum deduction is subtracted (a fixed amount per earner in the case of a single person or dual earner family, and a different amount in the case of one-earner couples) from the total of calculated withholding tax. Next, a number of additional deductions apply that depend on the family situation (dependent children, other dependent, single parent). These applicable amounts (cf. Table 41) are additionally deducted from the obtained tax sum.

**Table 41. Reductions from basic withholding tax sum**

Family situation	Deduction (€/year)			
	2012	2013	2014	2015
Lump sum per person earning income	1,546.15	1,546.15	1,546.15	1,546.15
Lump sum for one-earner household	3,092.30	3,092.30	3,092.30	3,092.30
For the first dependent child	396*	396*	396*	396*
----- second -----	672*	672*	672*	672*
----- third -----	1776*	1776*	1776*	1776*
----- fourth -----	2352*	2352*	2352*	2352*
----- fifth -----	2484*	2484*	2484*	2484*
----- sixth -----	2472*	2472*	2472*	2472*
----- seventh -----	2484*	2484*	2484*	2484*
----- eighth -----	2664*	2664*	2664*	2664*
For each child beyond the eighth	2760*	2760*	2760*	2760*
For single persons	276	276	276	288
Single parents with dependent children	396	396	396	408
Not (re)married widow(er) with dependent children	396	396	396	408
For each other dependents than own children	396*	396*	396*	408
If the taxpayer him/herself is handicapped	396	396	396	408
Ascendants and relatives older than 65	792	792	792	812

\* if the child or dependent person is handicapped, the applicable amount is doubled.

After the relevant deductions you get the equivalent of the yearly amount of withholding tax. Of course, the amount is then divided by the relevant period (e.g. divided by 12 for persons that are paid on a monthly basis) to obtain the amount that is actually withheld on the pay slip.

- ***Special social insurance contribution – determination of withheld amount***

The special social insurance contribution is already discussed in paragraph 2.4.2. As mentioned there, it is withheld every month and appears on the pay slip. In this paragraph, only the calculation of the monthly withheld amount is explained. The final amount, however, is calculated after the settlement of taxes, according to the rules explained in paragraph 2.4.2.

Table 42. Calculation rules of the monthly withheld special social insurance contribution [2012-2015]

Monthly gross income = X	Single person	Spouse in dual earner couple
	Earning spouse in single earner couple	Monthly withheld amount (€)
X < 1,095.10	0	0
1,095.10 <= X < 1,945.39	0	9.3
1,945.39 <= X < 2,190.19	7.6% of (X-1,945.39) With a maximum of 18,60	7.6% of (X-1,945.39) With a maximum of 18,60 and a minimum of 9,30
2,190.19 <= X < 6,038.83	18.60 + 1.1% of (X-2,190.19)	18.60 + 1.1% of (X-2,190.19) With a maximum of 51.64
X >= 6,038.83	60.94	51.64

Thresholds and amounts have remained unchanged over the period 2012-2015.

## 2.6 Personal income tax (tin\_s)

The tax structure has changed considerably because of the 6<sup>th</sup> State Reform. We highlight the two most important changes. First the regions now can levy personal income taxes autonomously, before it was the sole responsibility of the federal state. The rate structure and tax base remain the same, but after calculation of the *State tax* (see figure below), the taxes are multiplied by the so-called *autonomy factor*, reducing it to the *reduced State tax* (tinna\_s). Federal tax credits are then subtracted from the reduced State tax to have the federal income tax. Since the reform, the regions are now free to define a tax structure, based on the reduced State tax. By default the rate is fixed to 35.117%. This tax corrected for regional increases, reductions and credits forms the regional personal income tax. In Euromod, we do not make a distinction between federal and regional fiscal expenditures.

Figure 1: General principles - federal and regional PIT

### 2.6.1 Tax unit

The tax unit typically consists of a single person or married couple, (or couples with a legal union),<sup>16</sup> with dependent persons. Household members that satisfy one of the following conditions are possibly fiscally dependent:

- descendants of the taxpayer or his/her spouse (no age limits)
- children (up to 18 years old) who are not descendants but for whom the taxpayer or his/her spouse bears responsibility
- ascendants of the taxpayer or his/her spouse
- relatives of the taxpayer or his/her spouse
- individuals of whom the taxpayer was him- or herself dependent in the past, according to tax legislation.

<sup>16</sup> Married couples form a fiscal unit from the year following the year of marriage onwards.

To qualify as dependent one's own income may not surpass certain limits. If it does, the individual is considered a separate tax unit.

To determine a potentially dependent person's own means, the tax legislator takes into account both non-taxable and taxable income sources. Among the latter a further distinction is made between 1) occupational income, 2) real estate income, 3) income from assets, and 4) other income sources.

In case of income from a professional activity (occupational income) one compares 80% of gross taxable income<sup>17</sup> with gross taxable income minus the costs incurred to obtain this income and takes the lower of the two. The incurred costs can either be real or lump sum (cfr. section 2.6.3 for more details).<sup>18</sup>

For replacement incomes the standard rate of 80% is used to determine net own means from replacement income.

For income from unrented property the minimum is taken of cadastral income and 10/6 (developed) or 10/9 (undeveloped) of cadastral income minus real incurred costs.<sup>19</sup> If the property produces rental income then the minimum is taken of the received rent minus the real costs and 60% of the received rent for developed property or 80% of rent received for undeveloped property.<sup>20</sup>

Income from assets is counted in net own means as the minimum of gross income from assets minus real costs and 80% of gross income from assets.

For maintenance allowances (alimony) and income from non taxable sources one takes 80% of the (gross) amount as net own means.

In the case of children child allowances, birth and adoption allowances, scholarships, alimony and earnings of disabled children from employment in sheltered workplaces are not included in the means test for net own means and they are not taxable either.

In order to qualify as a dependent, the yearly net own means for children cannot exceed the thresholds summarized in Table 40.

Other rules apply for assessing the dependency of (grand)parents. The principal amount remains the same, but if the persons are 65 or older and enjoy pensions, part of the latter (up until the maximum limit) is exempted, i.e. not considered in the determination of net own means. Couples of (grand)parents are assessed together: if their common yearly net own means are below the lower threshold, both (grand)parents are dependent. If net own means are exceeding the lower threshold but remain below the second threshold, only the (grand)parent with the lowest net own means is considered dependent. If net own means are above the second threshold then none of the (grand)parents are dependent.

---

<sup>17</sup> Gross taxable income consists of gross earnings minus personal social security contributions. The special contribution for social security for households with income exceeding €18592.02 is not deductible. Contributions paid by pensioners with a pension exceeding €91.57 a month are deductible (amounts unchanged over 2011-2014).

<sup>18</sup> In case of income from professional activity if the costs thus calculated should be lower than €350 then the latter amount applies (if not larger than gross taxable income). In the implementation, the choice for 80% of gross taxable income is assumed (in the definition of the income list).

<sup>19</sup> Not simulated due to lack of data.

<sup>20</sup> In the implementation, 60% of rent is assumed (variable ypr).

Table 43. Thresholds for net own means to assess dependency

Thresholds below which one is a dependent	Net own means (€/year)			
	2012	2013	2014	2015
Children in couple households	€2,990	€3,070	€3,070	€3,070
Children of lone parents	€4,320	€4,440	€4,440	€4,440
Single (grand)parent	€2,990	€3,070	€3,070	€3,070
Couple (grand)parents - both dependent (1 <sup>st</sup> threshold)	€2,990	€3,070	€3,070	€3,070
Couple (grand)parents - one dependent (2 <sup>nd</sup> threshold)	€5,480	€5,630	€5,630	€5,630
Amount to which pension is exempted from the assessment for (grand)parents older than 65	€24,070	€24,760	€24,760	€24,760

## 2.6.2 Exemptions

Following Verbist (2004), we define exemptions as “income components [that] are part of pre-tax income, but do not have to be declared to the tax authorities, and thus are not included in the concept of taxable income (e.g. child benefits in most countries)”.

In Belgium this applies for child benefits, study allowances, social assistance benefits, war pensions and benefits in case of a work-related accident or sickness for a person without any other income.

## 2.6.3 Tax deductions

Here, we define tax deductions as any amount subtracted from pre-tax income (including social insurance contributions).

In the Belgian tax system, a number of deductions apply. Two categories can be distinguished. First, the social insurance contributions are deducted from gross income. As social insurance contribution is extensively discussed in section 2.4, it is not treated here. Secondly, there are the deductions related to expenses. The expenses are subtracted from the total taxable income. The simulation possibilities of this category are limited. As detailed expenditure data lack from the data, it is impossible to reconstruct the deductions. Three exceptions to this apply: paid alimony, professional expenses and mortgage repayments (made up of a capital repayment part and an interest repayment part). The net taxable income that results from the following rules can then further be reduced by declared expenses such as charitable donations, life insurance premiums, contributions to private pension plans and childcare costs (not simulated).

### 2.6.3.1 Alimony

Paid alimony is available in the data and is deductible up to 80% of the paid amounts if the beneficiary does not live in the same household as the taxpayer and the payment must be the result of a court order.

### 2.6.3.2 Professional expenses

For all workers, gross taxable income from a professional activity is reduced by the amount of professional expenses incurred, or by a lump sum amount, whichever is most favourable. In the case of real costs the taxpayer must prove these costs if asked for by the tax legislator. In EUROMOD, lump sum costs are simulated for every worker.<sup>21</sup>

<sup>21</sup> Self-employed usually don't make use of the system of assumed professional expenses, and usually choose to prove their costs by means of the invoices. In the EUROMOD database, the actual professional expenses of the self-employed are not available, so the wage-related formula is assumed to apply to their professional expenses as well.

To determine the lump sum amount of professional expenses the following rates are applied:

Table 44. Schedule for lump sum deduction of professional expenses [2015]

Gross taxable income in euro [2014]	Rate applied on gross taxable income
>0 and ≤5760	29.35 %
>5760 and ≤11380	10.5 %
>11380 ≤19390	8.0 %
>11540	3.0 %
Max. amount lump sum costs	€4090 / year

For managers and self-employed only one rate of 5% on gross taxable income applies to determine the lump sum amount of work related costs with a maximum.

### 2.6.3.3 Mortgage repayment

In 2005 onwards, the tax treatment of the dwelling one owns has changed considerably. The former system remains however applicable for mortgages concluded before 1/1/2005. Therefore we distinguish in the description the pre-2005 system and the post-2005 system.

#### A. Pre 2005 system

Before 2005 ‘cadastral income’ was part of taxable income. ‘Cadastral income’ (CI) is the average normal net income that real estate provides to its owner. This corresponds to an estimation of the average normal net rent value of the property for one year (at the reference time, which is 1 January 1975). CI is subject to annual *indexing* (the index for tax year 2010 is 1.5461). There were 4 possibilities of tax relief an owner could cumulatively apply for: (a) the normal interest deduction, (b) the housing deduction, (c) the additional interest deduction, and (d) the tax credit for capital redemption payments.

- (a) The *normal interest deduction*: interest payments on mortgages for purchasing or renovating a home can be deducted from income from real estate, if the loan has a term of at least 10 years. This deduction cannot exceed CI. If there are remaining interest payments, the balance can be deducted from the income from real property of the other spouse, without exceeding it. An additional deduction may apply to the still remaining part of the interest payments, as will be explained in Part (c).
- (b) The *housing deduction*: part of CI is exempt from taxes, which is known as the housing deduction. This amount is increased for each dependent person (incl. spouses), for disabled heads or partner, and for widow(er)s with dependent children. Depending on the level of the taxable income, owner-occupiers can be entitled to a so-called additional dwelling allowance. The deductible amount of both the dwelling and the additional dwelling allowance may not exceed income from real estate. It is possible that the total deduction that would be granted to a spouse exceeds the taxable income from real property. In this case the balance can be deducted from the income from real property of the other spouse, without exceeding it: the total amount of income from real property of both spouses cannot be negative.
  - The ordinary housing deduction (*gewone woningaftrek / abatement ordinaire*): The deduction is granted per spouse for his (part of the) cadastral income. The exemption amounts to 4,640 euro (2010), raised by 390 EUR for each dependent person. This increase is divided on a 50/50 base between both spouses.

- The additional housing *deduction (aanvullende woningaftrek / abatement complémentaire)*: When the total of the net income (including the remaining indexed cadastral income) is not higher than 32,530 euro (amount for 2010), an additional deduction is granted that is equal to half of the difference between the total indexed cadastral income and the ordinary housing deduction. This rule is applicable for each spouse.
- (c) The *additional interest deduction*: the interest that remains after the normal deduction of interest may likewise be deducted from total income on condition that the mortgage was raised in order to build, purchase or renovate a home in Belgium, and that the loan was contracted between 30 April 1986 and 31/12/2004 for a term of at least 10 years. The maximum amount of the loan value taken into account is determined using Table 42. For mortgages concluded from 1986 to 1988, the amounts for 1989 are used, including the increases for dependent children. If the total amount of the loan is lower or equal to the maximum amount, then the full amount of the capital payments can be declared. If not, the following formula is applied:
- remaining interest payments x maximum amount / total value of the loan*
- On the resulting amount a percentage is applied that determines the effectively applicable deduction for the remaining interest payments: it is restricted in function of the number of years that the rental value income of the real property in question has been included in the taxable income. For the first five taxable years, the deduction amounts to 80%, and for the next seven years it diminishes by 10% yearly, ending with a deduction of 10% in the twelfth year:
- from the first to the fifth year, 80%
  - for the sixth year, 70%
  - for the seventh year, 60%
  - for the eighth year, 50%
  - for the ninth year, 40%
  - for the tenth year, 30%
  - for the eleventh year, 20%
  - for the twelfth year, 10%
- The deduction is proportionally applied to the income of each spouse.
- (d) The *tax credit for capital redemption payments*: the capital redemption for a mortgage loan with a term of at least 10 years entitles an owner-occupier to an extra tax reduction (in the form of a tax credit). This reduction is calculated on a maximum limit of the initial loan, which is comparable to that applied for the additional interest reduction. It depends on the year in which the mortgage was concluded.
- Loans concluded from 01.01.1963 to 31.12.1988: Only part of the total amount of the loan is taken into account for the tax reduction. The maximum amounts are listed in Table 43. For mortgages concluded from 01.05.1986 to 31.12.1988 we will assume a new medium sized house.

Table 45. Maximum amounts taken into account for loans concluded from 01.01.1963 to 31.12.1988

Date of the mortgage	Nature of the house	Maximum amount
from 01.01.1963 to 30.04.1986	medium sized house	9,915.74
from 01.05.1986 to 31.12.1988	medium sized house	9,915.74
	new medium sized house	49,578.70

If the total amount of the loan is lower or equal to the maximum amount, then the full amount of the capital payments can be declared. If not, the following formula is applied:

$$\text{capital payments} \times \text{maximum amount} / \text{total value of the loan}$$

The result is eligible for a tax reduction. Assuming the house is the main residence of the owner, the reduction is calculated at the marginal income tax rate of the lender. The amounts that are eligible for the reduction are multiplied with the tax rate that is applicable to the highest income tax bracket of the lender. The result of that calculation is then subtracted from the personal income tax, without exceeding it.

- Loans concluded from 01.01.1989 to 31.12.2004: Again, only part of the total amount of the loan is taken into account for the tax reduction. The amounts are raised by 5%, 10%, 20% or 30% when there are 1, 2, 3 or more dependent children in the house. The maximum amounts are listed in Table 43.

Table 46. Maximum amounts taken into account for loans concluded from 01.01.1989 to 31.12.2004, depending on the number of dependent children.

	Number of dependent children				
	0	1	2	3	>3
1989	49.578,70	52.057,64	54.536,58	59.494,45	64.452,32
1990	51.115,64	53.668,95	56.222,25	61.353,65	66.460,25
1991	52.875,69	55.528,15	58.180,61	63.460,74	68.740,87
1992 to 1998	54.536,58	57.263,40	59.990,23	65.443,89	70.872,76
1999	55.057,15	57.808,77	60.560,39	66.063,62	71.566,86
2000	55.652,10	58.453,29	61.229,70	66.782,52	72.360,12
2001	57.570,00	60.440,00	63.320,00	69.080,00	74.830,00
2002	58.990,00	61.930,00	64.880,00	70.780,00	76.680,00
2003	59.960,00	62.950,00	65.950,00	71.950,00	77.940,00
2004	60.910,00	63.960,00	67.000,00	73.090,00	79.180,00

If the total amount of the mortgage is equal or lower than the maximum amount, the full amount of the capital payments can be declared. If not, the following formula is applied:

$$\text{capital payments} \times \text{maximum amount} / \text{total value of the loan}$$

The resulting amount is again calculated at the marginal income tax rate of the lender and subtracted from the personal income tax, without exceeding it.

For mortgage loans that started before 2005, the measures (a) to (d) still apply. For mortgages concluded after 2004, however, an entirely new system was installed.

#### B. 2005-2014 system

From 2005 onwards, the described measures have been abolished, and the CI of the only self-occupied dwelling has become tax exempt in the personal income tax system. For owners with a mortgage loan that is contracted after 1 January 2005, the three other tax advantages (interest deduction, additional

interest deduction, tax credit for capital redemption payments) have been replaced by the so-called ‘dwelling bonus’, which is only applicable for mortgages contracted for the own, self-occupied and only dwelling and that have a term of at least 10 years. When these conditions are fulfilled, the tax payer can deduct each year a basic amount of 1,500 Euro from his taxable income (indexed to 2,280 Euro for tax year 2014). This basic amount can be increased with (a) 500 Euro (760 for 2014) during the first 10 years of the term of the mortgage and with (b) 50 Euro (80 Euro for 2014) when there are three or more dependent children in the household on 1 January of the year that follow on the year in which the mortgage was concluded. The amounts are subtracted from the total net income of each spouse, without being limited to the total amount of the income from real properties. The tax advantage is thus applied at the marginal tax rate, so the effective advantage depends on the tax brackets that are applied to the taxpayer’s income.

*Aspects of policy that were not implemented*

- (1) There are conditions on the duration of the mortgage. We assume that those are fulfilled.
- (2) There are specific rules for social houses.
- (3) We do not really know if a house is medium sized. We assume it.
- (4) Specific rules apply for mortgages that were taken out to repay other mortgages.
- (5) There are also reductions for premiums paid for life insurances.
- (6) We do not know how many dependent children there were when the mortgage was concluded. We just count the current number of dependent children.
- (7) We assume that the owner obtained the house by buying it in the market. Different rules apply e.g. for houses acquired through inheritance.
- (8) Specific rules apply when one mortgage is taken out by multiple persons.

C. 2015 - now

As part of the 6<sup>th</sup> State Reform, fiscal policy concerning housing was transferred to the regions as of January 2015. The fiscal *Woonbonus* thus became a regional tax reduction for contracts of 2015 onwards. Brussels, Wallonia and Flanders maintained the structure of the instrument, with one important change: the benefit of the instrument is no longer defined by the marginal tax tariff but by a fixed rate.

Table 47. Regional housing bonus [2015]

Type of replacement income	Brussels	Flanders	Wallonia
Tariff of the tax reduction	45%	40%	40%
Maximum (standard) housing bonus	€2,260	€2,260	€2,260
Increase of max during first 10 years	€750	€750	€750
Increase of max for large families (3+ children)	€80	€80	€80

D. Treatment of mortgage in uprated years

To avoid that we simulate a proportion-wise decrease in eligible households, we assume that in the years following the baseline: mortgage was concluded in the reported year +n (baseline year + n).

## 2.6.4 Tax base

To calculate personal income taxes we need to determine the tax base, i.e. net taxable income. This is done by subtracting the tax deductions discussed in section 2.6.3. from gross income,<sup>22</sup> excluding the tax credit for capital redemption.

All replacement incomes are taxable except for the one exempt from taxation enumerated in section 2.6.2. (income support, war pensions and benefits in case of a work-related accident or sickness for a person without any other income).

For certain income from assets, such as dividends, interest from bonds and other fixed income securities, there is no obligation to declare since taxes are withheld at the source (simulated separately, see section 2.7.). Other income from assets such as income originated and collected abroad and interest on savings in a savings account should be declared.<sup>23</sup> Income from assets can be taxed separately or jointly with other income, whichever is more advantageous for the taxpayer. In EUROMOD it is assumed that separate taxation is more advantageous, because of the low average rate (15%).

Other income sources include maintenance allowance (alimony) of which 80% is subject to taxation.

Occasional profits and benefits are taxed net of incurred costs. These do not include profits and benefits from regular exploitation of a private enterprise or estate, nor do they include winnings from lotteries or games.<sup>24</sup>

Some income items are taxed separately such as wages overdue, holiday allowance paid up-front, capital from collective insurance contracts. These are, however, not simulated because the data are not detailed enough in this respect.<sup>25</sup>

Also taxed separately are income from assets, awards, and certain subsidies (cfr. section 2.7).

---

<sup>22</sup> Losses that are incurred can be deducted from any positive income to establish taxable income. Moreover, losses are transferrable without limitation to other tax years to be set off against positive income. Because data from other years are not disposable, this is not simulated.

<sup>23</sup> In case of savings accounts the first €1,730 in interest on savings per spouse is exempt from taxation altogether. As it is not possible to identify which income is from interest on savings accounts, this policy is switched off.

<sup>24</sup> For awards and subsidies the tax base is the received amount plus any withholding taxes minus gifts to Belgian universities or other recognized institution for scientific research. Awards and subsidies are taxable only for the part that exceeds €3,460. (not simulated)

<sup>25</sup> It concerns the following items (not simulated) :

Income from assets	15 to 25%
Occasional profits	33%
Awards and subsidies	16.5%
Income from subletting and transfer lease	15% from March 1st 1990; 25% otherwise
Capital gain real estate	16.5%
Capital gain land (for construction)	33% if sold within 5 yrs of acquisition.; 16.5% ow
Wages and replacement incomes overdue	average tax rate previous year
Severance pay of more than €750 gross	idem
Holiday earnings paid in advance	idem
Capital from life or collective insurance contracts, or pension plans	33%, 16.5% or 10%

### 2.6.5 Federal tax schedule

The rate structure in the table below is applied to individual net taxable income to determine the gross amount, before any other reductions (cfr. section 2.6.6), of personal income taxes.

Table 48. Tax schedule federal tax

Tax brackets	Upper limits of yearly net taxable income				Rate applied
	2012	2013	2014	2015	
1 <sup>st</sup> bracket	8,350	8,590	8,680	8,710	25%
2 <sup>nd</sup> bracket	11,340	12,220	12,360	12,400	30%
3 <sup>rd</sup> bracket	19,819	20,370	20,600	20,660	40%
4 <sup>th</sup> bracket	36,300	37,330	37,750	37,870	45%
5 <sup>th</sup> bracket	∞	∞	∞	∞	50%

As discussed above, the amount of income corresponding to the tax free amount is exempt from tax. This means that the rate structure applies on the entire net taxable income, and in the end the tax due on the base allowance (after applying the rate structure on that amount) is subtracted to obtain the final tax amount.

In the case of married couples the tax legislator allows for income sharing between spouses up to a certain limit (the so-called ‘marital quotient system’). If one of the spouses earns less than 30% of the couple’s total net taxable income, income between spouses is shared as if the higher earning spouse earned 70% of total household income from professional activity and the other spouse 30%. The amount thus transferred is limited (amounts see Table 49) and may not exceed 30% of total household professional income. After this income sharing, the rate structure is applied to both individuals as if the income was their own individual income. This implies that the transferred part of the income is taxed against a much lower marginal rate than if it would have been had it not been transferred, i.e. if it had remained part of the income of the higher earning spouse.

In the case of self-employed part of the income can be transferred to the “co-working” spouse is slightly higher. The compensation should be in relation to the services provided by the spouse of the self-employed and cannot exceed 30% of total income earned with the help of the spouse. We assume that the sharing is in relation to the services.

If the professional income of one of the spouses is negative, this can be deducted from the earnings of the other spouse without, however, exceeding those earnings (not simulated).

Table 49. Marital quotient limits

Type of replacement income	2012	2013	2014	2015
Max. yearly amount transferred to the other spouse	€9,810	€10,090	€10,200	€10,200
In case of co-working spouse for self-employed	€12,740	€13,100	€13,240	€13,240

#### Municipality taxes

Municipality tax rates are collected in addition to the above tax schedule. The rates vary from 2.5% to 9.0%. As in EUROMOD database we do not dispose of municipality information, these taxes are calculated taking 7.6% (Brussels), 7.2% (Flanders) and 7.9% (Wallonia) of calculated national taxes. This percentage corresponds to the proportion of aggregated municipality taxes / aggregated national taxes in the administrative fiscal data.

## 2.6.6 Tax credits

### 2.6.6.1 Tax free amounts for family size and composition

The tax legislator grants the taxpayer an income amount that is exempt from taxation. The exemption is from the bottom up. This means that the taxes due on that amount are calculated following the normal income brackets and applicable rates. The amount that is then obtained will be deducted from the final tax payment calculated on total net taxable income.

The basic amount is applied per taxpaying person regardless the marital status. It is the same for all individuals. In a cohabitating couple consisting of two tax units each person will individually get the basic amount allocated, and in a married couple that makes up a single tax unit, it will also be granted to each spouse separately. If the income of one of the married spouses is less than the basic exempted income amount however, the remainder can be transferred to the other spouse (if his or her income is sufficiently large).

If the taxpayer is disabled the basic amount is increased, and the tax free amount is further increased for each dependent child<sup>26</sup>, as well as for a number of specific family situations:

**Table 50. Tax free amounts, basic amounts and for special family situations**

	Increase of the tax free amount			
	2012	2013	2014	2015
Basic amount (per taxpayer)	€6,800	€6,990	€7,070	€7,090
Disabled taxpayer	€1,440	€1,490	€1,500	€1,510
Amount per child for first child	€1,440	€1,490	€1,500	€1,510
----- for second child	€2,280	€2,330	€2,370	€2,370
----- for third child	€4,610	€4,750	€4,800	€4,820
From fourth child onward	€5,150	€5,290	€5,350	€5,370
Ascendants and relatives older than 65	€2,890	€2,970	€3,000	€3,010
Other dependent person	€1,440	€1,490	€1,500	€1,510
Handicapped dependent person	€1,440	€1,490	€1,500	€1,510
Lone parent with dependent children	€1,440	€1,490	€1,500	€1,510
Max. amount refundable tax credit (per child)	€420	€430	€430	€430
Low taxable income	€25,270	€25,990	€25,990	€25,990
----- additional amount	€270	€280	€280	€280

If the tax free amount exceeds the actual income, the result is that no taxes have to be paid, but no compensation exists for the ‘remainder’ of the tax free amount, the part that one cannot ‘use’ because income is insufficient. However, if the increase of the tax free amount is due to increases related to children, then part of the tax free amount is refundable in the form of a tax credit for children, with applying limit per child in Table 46.

### 2.6.6.2 Credits in the case of replacement income

When part of one’s income stems from replacement income (unemployment benefits, early retirement benefits, sickness and disability benefits, pensions), tax credits are applicable to that part. In 0 the yearly basic tax credits are shown for different types of replacement income. For all types of replacement income, the assessment unit is the individual, i.e. the recipient’s family situation does not influence the amount of the credit. The assessment unit of the unemployment benefit (regular and for older employees) is the individual (married or single). The family situation does not matter for the

<sup>26</sup> An extra lump sum increase of the tax deduction of €20 (2009) for each child younger than 3 is granted if no childcare costs are declared on the tax form for this child. (not simulated).

amount of the tax credit. In what follows it will be explained how these credits are further reduced in function of total income, for which the example of 2012 is used to exemplify the calculation schedule.

Table 51. Tax credits for replacement incomes

Type of replacement income	2012	2013	2014	2015
Pensions	€1,968.18	€2,024.12	€2,046.70	€2,024.12
Early retirement benefits	€1,968.18	€2,024.12	€2,046.70	€2,024.12
Unemployment benefits (incl. for elderly unemployed)	€1,968.18	€2,024.12	€2,046.70	€2,024.12
Sickness and disability benefits	€2,526.49	€2,598.29	€2,627.29	€2,598.29

These credits are further reduced “horizontally” and “vertically”.

#### Horizontal limit

The tax credit is limited to the proportion of replacement income in total net taxable income. A taxpayer receiving unemployment benefits of €2,500 and net taxable income from professional activity of €10,000 will only be eligible to receive 1/5 of the tax credit related to unemployment benefits ( $2500/(10000+2500)$ ), where €12,500 is the *total* net taxable income in this example. This rule is applied on the “calculation basis”, before application of the marital quotient system (cfr. section 2.6.5).

#### Vertical limit

The general rule which is applicable to all replacement incomes except the regular unemployment benefits is as follows, where R is the reduction after applying the horizontal limit, and NTI is net taxable income (at the level of the tax unit):

Table 52. Determination of vertical limit of the tax credit for replacement income (except regular unemployment benefits) [example for 2012]

$NTI < €1800$	$R' = R$
$€1060 \leq NTI \leq €43610$	$R' = R * 1/3 + [R * 2/3 * (43610 - NTI) / 21800]$
$NTI > €43610$	$R' = R * 1/3$

In case of regular unemployment benefits the following rules apply:

Table 53. Determination of vertical limit of the tax credit for regular unemployment benefits [2012]

$NTI < €1800$	$R' = R$
$€1800 \leq NTI \leq €7230$	$R' = R * (7230 - NTI) / 21800]$
$NTI > €7230$	$R' = 0$

The reductions that are obtained after applying the horizontal and vertical limits cannot be more than that part of the tax that is proportional to the tax base on which they apply. It means that the reduction as a proportion of the total tax cannot be more than the replacement income as a proportion of total net taxable income.

After all the reductions the taxes due can be further reduced to zero in case taxable income’s sole component is replacement income –and only one type of replacement income– and does not exceed the following amounts:

Table 54. Upper limits for further reduction to zero taxes in the case of pure replacement income

Type of replacement income	2012	2013	2014	2015
Unemployment benefits for the elderly unemployed (aged 58 or more)	€16,538.89	€17,477.08	€17,477.08	€17,477.08
Regular unemployment benefits, pensions, early retirement and other replacement income	€14,914.71	€15,443.08	€15,443.08	€15,443.08
Sickness and disability benefits	€16,571.90	€17,158.98	€17,158.98	€17,158.98

### 2.6.6.3 Refundable tax credit on low activity incomes

Low activity incomes are incomes from professional activity net of costs, either real or lump sum that are not replacement incomes, wage incomes (except for statutory civil servants)<sup>27</sup> or other separately taxed incomes. It implies that this tax credit is applicable only for self-employed and statutory civil servants. The base for the calculation of the credit is before application of the marital quotient and is calculated per spouse. The credit calculated according to the rules in the table below is limited to the ratio of activity income in total net income from professional activity. The tax credit is refundable.

Table 55. Calculation structure for the refundable tax credit on low activity incomes [2012]

Net income in euro (I)		Tax credit in euro
G1	G2	
0	4,610	0
4,610	6,150	$620 * (I - G1) / (G2 - G1)$
6,150	15,380	620
15,380	19,990	$620 * (G2 - I) / (G2 - G1)$
19,990	and more	0

## 2.7 Investment income taxes (*tinkt\_s*)

For certain income from assets, such as dividends, interest from bonds and other fixed income securities, there is no obligation to declare since taxes are withheld at the source, at a rate ranging between 15% and 25%. In principle, income from assets can be taxed separately or jointly with other income, whichever is more advantageous for the taxpayer. The assumption in EUROMOD is that this income is taxed at the source and is hence not taken up in taxable income. An average tax rate of 15% on gross investment incomes is assumed.

Other income from assets such as income originated and collected abroad and interest on savings in a savings account should be declared. In case of savings accounts the first €1,830 in interest on savings per spouse is exempt from taxation altogether. Because with the EUROMOD data it is not possible for investment income to distinguish whether it comes from abroad or not, whether it originates from interest on savings account or not, these details are not simulated. Hence, all investment income is treated in the same way and taxed at an average rate of 15%.

## 2.8 Advanced levy on immovable property (*tprhm\_s*)

Real estate taxes are implemented as part of personal income tax.

<sup>27</sup> Wage earners that are not eligible for this tax credit are in principle eligible for a reduction in personal social security contributions.

*Cadastral Income.* Every property in the country is listed in the Cadastre (land registry) and an annual net rental income is assigned to it: the cadastral income. This value corresponds to the net rental income of the property on the 1st of January 1975, plus a ratio of adjustment to today prices, re-evaluated every year. To assess the cadastral income the Cadastral administration takes into account both the building itself (number of rooms, cellar, garage, general condition etc.) and more general factors affecting the building or its environment (ease of access, distance from main highways, etc.). Cadastral income needs to be declared on the tax form. However, taxes on cadastral income, Belgium’s main real estate tax, are paid separately. Therefore taxes due on cadastral income are “settled” against the final tax payment at a rate of 12.5% of the part of cadastral income that is effectively taken up in the tax base.

*Principles of the real estate tax.* The so-called “advance levy on immovable properties” (onroerende voorheffing / précompte immobilière) is a regional tax on immovable properties, outside the personal income tax. Its amount is based on the indexed cadastral income<sup>28</sup> (e.g. in 2009, the index was 1.5461):

- Flemish Region: 2.50% of the indexed cadastral income
- Walloon Region and Brussel-Capital Region: 1.25%

The owner of a modest house (non-indexed cadastral income on all immovables <= 745 EUR) can obtain a reduction of 25%.

*Surtaxes.* Provinces, agglomerations and municipalities can levy surtaxes on these regional taxes. These surtaxes are a percentage increase of the base levy. A surtax of 100 means that for each euro of regional tax, an additional euro is levied for local authorities. Since we do not have detailed information on the geographic position of the house, we use average surcharges for each region, as shown in Table 53.

Table 56. Average surtaxes per region in %

Total average surtaxes per region (municipality + agglomeration rates together)	2012	2013	2014	2015
Brussels	3389	3389	3389	3389
Flanders	1676	1676	1676	1676
Wallonia	4200	4200	4200	4200

*Reductions for dependent children.* If the owner of the house has dependent children he may be entitled to a reduction, dependent on the region.

- o **Flemish Region**

In the Flemish Region the owner is entitled to a reduction if he has two or more dependent children. The lump sum reductions are listed in Table 57. The amounts are indexed annually.

<sup>28</sup> If the property is the second home or rented to a natural person that does not use it for professional activities or rented to a legal person that is not a corporation and that sublets to (a) natural person(s) to use the property as residence then the indexed cadastral income is further increased by 40%. If the property is rented to a natural person for professional activity or to a corporation then the tax base is rental income net of a 40% lump sum cost allowance. The net rent may not be lower, however, than the indexed cadastral income plus 40% (not simulated).

Table 57. Lump sum reductions for dependent children in the Flemish Region

Number of dependent children	Reduction			
	2012	2013	2014	2015
2	7.30	7.51	7.59	7.62
3	11.56	11.89	12.02	12.06
4	16.19	16.65	16.83	16.89
5	21.22	21.82	22.07	22.14
6	26.62	27.37	27.68	27.77
7	32.42	33.34	33.71	33.83
8	38.63	39.73	40.17	40.31
9	45.21	46.49	47.01	47.17
10	52.21	53.70	54.29	54.48

○ **Brussels Region**

In the Brussels-Capital Region the owner must have at least two children alive, including one dependent child. The owner then is entitled to a reduction of 10% for each dependent child.

○ **Walloon Region**

In the Walloon Region a reduction of 125 euro is granted for each dependent person.

*Aspects of policy that were not implemented*

- Properties that are let as social houses are subject to a lower tax rate.
- Disabled persons and war disabled persons are entitled to a reduction, different for each region.
- Under certain conditions, there is a reduction for nonproductive houses.
- Houses for which an energy performance certificate (energieprestatiecertificaat) exists can enjoy a reduction.
- The reduction for modest houses for inhabitants of the Flemish Region is only applicable for houses that are in the Flemish Region. Our data does not cite the location of the house though. This is no problem, as we assume the house to be the only and the main residence of the owner.
- Average surcharges were used for each region, instead of detailed rates for each province, agglomeration and municipality.

### 3. DATA

#### 3.1 General description

The Belgian database consists of the Belgian part of the European Union Statistics on Income and Living Conditions. This is a rotating panel survey (4 rotational groups), representative of the Belgian population in private households. The survey takes place in the second half of the year following the income reference year. The unit of assessment is the sociological household, defined as the persons living at the same address. The response rate for the total sample (“old” households (3/4) and “new” households (1/4) together) is defined as (number of addresses successfully contacted / number of valid addresses contacted) \* (number of household interviews completed and accepted for the database / number of eligible households at contacted addresses) = 61.7. The User Data Base on which the EUROMOD database is based, is provided by Eurostat.

More information on technical issues concerning the Belgian contribution to the EU SILC 2012 can be found in its Quality Report:

[http://statbel.fgov.be/nl/binaries/BE-QualityReport%20SILC2012\\_tcm325-259435.pdf](http://statbel.fgov.be/nl/binaries/BE-QualityReport%20SILC2012_tcm325-259435.pdf)

Table 3.1 EUROMOD database description

	<b>SILC 2012 - Income Year 2011</b>
EUROMOD database	BE_2012_a2
Original name	EU-SILC_UDB_C12 (ver 2012-3 from 01-03-15)
Provider	Eurostat
Year of collection	2012
Period of collection	February-June
Income reference period	2011
Sampling	2-stage sampling; with stratification of sampling units (no clustering of sampling units)
Unit of assessment	Sociological household
Coverage	Private households
Sample size	13,951 individuals; 5817 households
Response rate	61.7% (household response rate for total sample)

### 3.2 Data adjustment

Adjustments to variables are kept to a minimum. There is some minor data cleaning that is done to make sure that the households and relationships of individuals within households, are coherent (for example, that both partners identify each other correctly, to rule out inconsistencies in family structure).

In order to guarantee consistency between demographic variables and income variables which refer to the previous year (and on which EUROMOD simulation are based), all children born between the end of the income reference period and the data of interview have been dropped from the sample.

### 3.3 Imputations and assumptions

#### 3.3.1 Time period

All income information in EU-SILC 2012 refers to the fiscal year 2011 (January – December). Monetary amounts in the original variables are normally expressed in yearly totals, unless otherwise indicated. Incomes and benefits are paid on a monthly basis in Belgium. For most income variables, information is included on how many months a certain wage or benefit was received.

For the construction of the EUROMOD database from EU-SILC, all monetary amounts are re-scaled to “an average month”, dividing all amounts by 12.

For non-monetary variables, two reference periods co-exist in EU-SILC. On the one hand, with respect to the reference year (2011) there is relevant information included on e.g. activity status and household composition, complementing the income information. On the other hand, a number of questions (on e.g. education activity, child care) refer to the “current” state at the time of the interview, which means during the first half of 2012.

In the EUROMOD database, the information refers as much as possible to the same reference period, to ensure a consistent picture with regard to income sources and non-monetary information such as labour market and socio-economic characteristics. Therefore, different sources of information available in EU-SILC are combined. In order of preference:

- 1) Direct information from EU-SILC referring to the income reference period (e.g. monthly labour market information) is being used where possible.

- 2) In addition, information on the income reference period is derived from the current reference period (e.g. education activity).
- 3) If no alternative is available, the current value is taken as the best proxy for the value during the income reference period (e.g. hours usually worked per week)

In this way, we approximate best the general consistency of the personal and household characteristics with the incomes that are reported.

### 3.3.2 Gross incomes

For the applicable income variables, gross and net incomes are both collected in the original data. Consistency checks between corresponding net and gross amounts were done by the National Statistics Office Belgium. Notes on the followed methodology can be found in the Quality Report ([http://statbel.fgov.be/nl/binaries/BE-QualityReport%20SILC2012\\_tcm325-259435.pdf](http://statbel.fgov.be/nl/binaries/BE-QualityReport%20SILC2012_tcm325-259435.pdf)).

For the construction of the EUROMOD dataset, the gross amounts were used (where applicable). The EUROMOD Working Paper EM16/14 “*Gross incomes in the Belgian SILC dataset: an analysis by means of EUROMOD*” by André Decoster, Dieter Vandelannoote, Toon Vanheukelom, and Gerlinde Verbist explores the choice for gross incomes by comparing SILC gross incomes (and the poverty and inequality estimated that stem these) to fiscal statistics on the one hand and a re-calibration approach based on SILC net incomes on the other hand.

<https://www.iser.essex.ac.uk/research/publications/working-papers/euromod/em16-14>

### 3.3.3 Disaggregation of harmonized variables

The variables for maternity benefit (bma), parental leave (bfapl), birth allowance (bchba), and regular child allowance (bch) are derived from SILC’s aggregated HY050 variable making use of eligibility rules, information on monthly economic status, previous wages, and partial simulation.

Early retired people are another important category in the Belgian tax-benefit system that is not identifiable from the SILC data. Moreover, respondents seem to have confused the legal status of “early retirement” with that of “older unemployed exempt from seeking work”. Imputations based on the national SILC data have been carried out to calibrate the balance between the two, yet, care should be given to interpreting results for these subcategories.

Civil servants were imputed using a probit approach based on information from the national SILC and a number of common variables like age, occupation, NACE, type of contract, education, number of persons working at the local unit. A similar procedure with different variables (such as number of rooms, mortgage interest paid, variables on quality of the dwelling) is applied to impute key variables (such as cadastral income (kh000), year that the mortgage was concluded (amoyl) and total loan value (amolv) for the simulation of the fiscal treatment of home ownership.

Table 58. Comparison of reported net monthly wage between 3 surveys for Belgium

	<b>Median</b>
LFS2003	1383.3333
LFS2004	1415
LFS2005	1466.6667

### 3.4 Data adjustment

Adjustments to variables are kept to a minimum. There is some minor data cleaning that is done to make sure that the households and relationships of individuals within households, are coherent (for example, that both partners identify each other correctly, to rule out inconsistencies in family structure).

In order to guarantee consistency between demographic variables and income variables which refer to the previous year (and on which EUROMOD simulations are based), all children born between the end of the income reference period and the date of interview have been dropped from the sample.

### 3.5 Imputations and assumptions

#### 3.5.1 Time period

All income information in EU-SILC 2010 refers to the fiscal year 2009 (January – December). Monetary amounts in the original variables are normally expressed in yearly totals, unless otherwise indicated. Incomes and benefits are paid on a monthly basis in Belgium. For most income variables, information is included on how many months a certain wage or benefit was received.

For the construction of the EUROMOD database from EU-SILC, all monetary amounts are re-scaled to “an average month”, dividing all amounts by 12.

For non-monetary variables, two reference periods co-exist in EU-SILC. On the one hand, with respect to the reference year (2009) there is relevant information included on e.g. activity status and household composition, complementing the income information. On the other hand, a number of questions (on e.g. education activity, child care) refer to the “current” state at the time of the interview, which means during the first half of 2010.

In the EUROMOD database, the information refers as much as possible to the same reference period, to ensure a consistent picture with regard to income sources and non-monetary information such as labour market and socio-economic characteristics. Therefore, different sources of information available in EU-SILC are combined. In order of preference:

- 4) Direct information from EU-SILC referring to the income reference period (e.g. monthly labour market information) is being used where possible.
- 5) In addition, information on the income reference period is derived from the current reference period (e.g. education activity).

- 6) If no alternative is available, the current value is taken as the best proxy for the value during the income reference period (e.g. hours usually worked per week)

In this way, we approximate best the general consistency of the personal and household characteristics with the incomes that are reported.

### 3.5.2 Gross incomes

For the applicable income variables, gross and net incomes are both collected in the original data. Consistency checks between corresponding net and gross amounts were done by the National Statistics Office Belgium. Notes on the followed methodology can be found in the Quality Report ([http://statbel.fgov.be/fr/binaries/BE-QualityReport%20SILC2010\\_tcm326-206841.pdf](http://statbel.fgov.be/fr/binaries/BE-QualityReport%20SILC2010_tcm326-206841.pdf)).

### 3.5.3 Other imputed variables

Because it was not possible to identify the civil servants in the EU-SILC, for the EUROMOD database, civil servants were imputed using a probit approach based on information from the national SILC and a number of common variables like age, occupation, NACE, type of contract, education, number of persons working at the local unit. A similar procedure with different variables (such as number of rooms, mortgage interest paid, variables on quality of the dwelling) is applied to impute key variables (such as cadastral income (khooo), year that the mortgage was concluded(amoyl) and total loan value (amolv) for the simulation of the fiscal treatment of home ownership. Finally, the variables for maternity benefit (bma), parental leave (bfapl), birth allowance (bchba), and regular child allowance (bch) are derived from SILC's aggregated HY050 variable making use of eligibility rules, information on monthly economic status, previous wages, and partial simulation.

Early retired people are another important category in the Belgian tax-benefit system that is not identifiable from the SILC data. Moreover, respondents seem to have confused the legal status of “early retirement” with that of “older unemployed exempt from seeking work”. Some imputations have been carried out to calibrate the balance between the two, yet, care should be given to interpreting results for these subcategories. For more detail, we refer to section 0.

## 3.6 Updating

The factors that are used to update monetary variables from the mid-point of the data year to mid-point of simulation years until 2010 are shown in Table 60.

No other updating adjustments are employed. Thus the distribution of characteristics (such as employment status and demographic variables) as well as the distribution of each income source that is not simulated, remain as they were in 2009.

Table 59. Updating factors

	2005	2006	2007	2008	2009	2010	2011	2012	2013	2014	2015
CPI	100.0	101.8	103.7	108.3	108.3	110.6	114.5	117.8	119.1	119.5	120.3

Gen. wages	100.0	102.0	104.1	109.3	120.3	117.6	120.7	125.0	130.1	130.1	130.1

Sources: Indices like consumer price index and health index, as well as specific indices for non-benefit incomes (employment income, investment income, property income) are published by Belgostat (<http://www.nbb.be/belgostat>). Indices of benefits are published by the relevant public services (health, pensions). The updating factors for the other benefits are calculated on the basis of the evolution of the official benefit amounts for a representative category (income support, unemployment, family benefits).

## 4. VALIDATION

### 4.1 Aggregate Validation

EUROMOD results are validated against external benchmarks. Detailed comparisons of the number of people receiving a given income component and total yearly amounts are shown in Annex 2. Both market incomes and non-simulated taxes and benefits in the input dataset as well as simulated taxes and benefits are validated against external official data. The main discrepancies between EUROMOD results and external benchmarks are discussed in the following subsections. Factors that may explain the observed differences are also discussed.

#### 4.1.1 Components of disposable income

Table Components of disposable income

	EUROMOD [year]	EU-SILC 2012
	ils_dispy	HY020
Employee cash or near cash income	+	+
Employer's social insurance contribution	0	0
Company car	-	+
Contributions to individual private pension plans	0	0
Cash benefits or losses from self-employment	+	+
Pension from individual private plans	0	0
<i>Unemployment benefits</i>	+	+
<i>Old-age benefits</i>	+	+
<i>Survivor' benefits</i>	+	+
Sickness benefits	+	+
Disability benefits	+	+
Education-related allowances	+	+
Income from rental of a property or land	-	+
<i>Family/children related allowances</i>	+	+
Social exclusion not elsewhere classified	+	+
Housing allowances	0	0
Regular inter-household cash transfer received	+	+
Interests, dividends, etc.	+	+
Income received by people aged under 16	+	+
Regular taxes on wealth	-	-
<i>Regular inter-household cash transfer paid</i>	-	-
<i>Tax on income and social contributions</i>	-	-
<i>Repayments/receipts for tax adjustment</i>	+	+

##### 4.1.1.1 Gross wages

Previous investigations on the validation of gross wages for detailed job categories in EU-SILC<sup>29</sup> showed that gross wages were on average about 13% higher in SILC2006 than in the statistics from the National Statistics Office based on the Structure of Earning Survey. However, it is very difficult to construct fully comparable data. A first difficulty concerns the definition of 'full time workers', which varies over surveys depending on structural design features such as the reference period. A second

<sup>29</sup> See table 54 in the Belgian EUROMOD Country Report 2005-2008

cause for deviation between the SILC-aggregates and other sources is that in the SILC data, also bonuses and holiday earnings are counted as wages, whereas this is not explicitly stated in the other sources. This could explain the slight upward bias of the EUROMOD wages, which are based on SILC, in comparison to this external source.

Table 60 validates the total of gross wages earned (on which social insurance contributions are due) against administrative statistics of the social insurance institutions. The number of employees and the total of gross wages are both overestimated in the EUROMOD database for baseline year 2012 (26% and 28%). However, the components of the income concept (wage) in this case are not entirely similar in the comparison. While the income from employment in EUROMOD contains all holiday payments, bonuses and even meal vouchers, the income concept of the social insurance institution (external source) does not contain a substantial part of the holiday payments, no performance related bonuses and no meal vouchers.

### 4.1.1.2 Taxable income

To have a more global picture of the amount of taxable income in EUROMOD, the total taxable income simulated is compared with the available fiscal data (Table 61). On the aggregate level, there is an underestimation (ratio 0.92 in 2012). Only for the region of Brussels, slightly higher taxable income is found in EUROMOD in comparison to the fiscal statistics. Of course, it must be kept in mind that the Brussels sample is fairly small, which can affect the accuracy of the Brussels results.

Table 62 shows the number of fiscal units. For those categories of taxable income above €10,000/year, the underestimation is of the order of 1 to 8% in 2012. However, the number of tax units with a taxable income lower than €10,000 is strongly underestimated (by 53%) in EUROMOD. The number of tax units in the highest band according to EUROMOD corresponds almost perfectly to the external statistics. Together this makes that overall there is a 11% underestimation of the total number of tax units in the country. At first sight, this is almost entirely caused by an underrepresentation of tax units with taxable income situated in the lowest tax bracket.

Complementary to the underestimation of tax units with low taxable income, Table 64 shows that average taxable income per tax unit is slightly higher when simulated in EUROMOD than in the administrative statistics.

There are three complementary explanations for this pattern:

1) Specifically with respect to the strong underestimation of tax units with taxable income lower than €10,000, a large part of it could be explained by the fact that the fiscal statistics include persons with a very small income (e.g. students on part-time jobs, for instance only during summer time) as separate fiscal units, even if they do not exceed the thresholds to belong to the fiscal unit of their parents.<sup>30</sup> In EUROMOD, these students are grouped into the fiscal unit of the family. For the results this should not matter (even if they are included as separate units in the statistics, for the actual calculation of due taxes (mostly none, as long as the thresholds are not exceeded) they are counted as part of the fiscal household of the parents). In addition, we should note that there is no specific question in SILC that mentions income from (mostly relatively small) holiday jobs. It depends on the student in question whether this income is mentioned as income from employment or not.

2) An additional reason for this can be that EUROMOD does not simulate some important deductible expenses, as the data lack information to adequately do this. The most important example is the actual professional expenses incurred (the so-called operating expenses). Others include gifts (to approved organizations), cheques from the local employment agency to hire household help (PWA-cheques), all kinds of energy-saving investments, investments for safety and security. Simulation of the deductible expenses would imply that some tax units would have lower taxable unit than what is now simulated.

---

<sup>30</sup> For a critical discussion of the methodology of the National Statistics Office, see Defeyt (2010).

3) The results seem to suggest that EU-SILC for Belgium contains too few people with low earnings. One reason for this might be that the fiscal data include persons in collective households (prisons, convents, homes for the elderly), while the SILC data only contain private households. This might lead to a small sample bias. If we assume that incomes of the tax units in collective households are on average often lower than in private households, this might contribute to the lower taxable incomes in the fiscal data as well. This would be in line with the evidence found in section 4.1.1 of the overrepresentation of employees in the database and their wages.

### 4.1.2 Validation of incomes inputted into the simulation

The following tables compare the available external sources with the statistics on benefits and taxes that are not simulated in EUROMOD. This provides an assessment of the quality of the database and also provides some useful background information for the validation of simulated components of income which may depend on or be associated with the non-simulated components. For these income components, the EUROMOD database is in fact equal to the original database (here SILC 2012), while the external source are administrative figures.

#### 1. Pensions

In Table 64, retirement pensions are assessed. The difference between old age pensions and survivor's pensions appeared unclear to the respondents. When assessed separately, the figures diverge considerably from administrative sources (old age pension being overreported, survivor pension underreported). However, when both pensions are aggregated, the ratio becomes closer to 1. The number of pensioners in our dataset of 2012 is 15% lower than in the administrative sources, while the total expenditure on pensions is almost equal with the administrative numbers in 2012. The slight underrepresentation of pensioners can be due to the fact that only private households were sampled in the EU-SILC, so persons in collective households, such as nursery homes, are not represented in the survey. At the same time, the comparatively high aggregate expenditure found allows us to assume that the amounts reported as state pension might sometimes also include non-state pension income components, such as income support for the elderly (which counts as social assistance) and/or some types of private pensions.

#### 2. Early-retirement pensions

For early retirement benefits (Table 65), the difference between administrative figures and the observation in SILC is wider. An important first remark concerns the definition of early retirees. The legal definition of an "early retiree", which implies also a special treatment of one's income in the tax-benefit system, is often obtained at times when company restructuring is responsible for making many workers redundant. The early retirement option contains a specific regulation where part of the monthly benefit is paid by the company until the person's retirement age and the other part by the unemployment institution. Officially, these workers are exempt from seeking work because of labour market reasons. Apart from early retirees, also some elderly unemployed are exempted from seeking work without them having the special statute of early retirees. However, among the population this situation is often referred to with the same term, so it is likely that some persons have answered this to the question on early retirement. Therefore, we have opted to include two definitions to validate the data on early retirement. The strict definition only refers to those in the legal statute of early retirees, while the loose definition also includes elderly unemployed who are exempt from seeking work. The EUROMOD database figures are somewhere in between for what concerns the number of persons. There is a serious overrepresentation when only taking the strict definition into account, while the loose definition appears too loose, and suggests that at least a substantial portion of the elderly unemployed exempt from seeking work reported their benefit correctly as unemployment benefit. As expected, total expenditure is higher in the EUROMOD data than in the administrative statistics, as the administrative sources only account for the part that is paid by the government. There are no official statistics on the second part of the benefit that early retirees receive, namely the substantial amounts that are paid by the companies.

### 3. *Unemployment benefits*

Table 66 shows that the number of unemployed individuals and the expenditures are underestimated more or less proportionally.

### 4. *Incapacity-related benefits*

With regards to the incapacity related benefits (cfr. Table 67), the number of recipients is underestimated by 44% in the EUROMOD data, while the total expenditure closely corresponds to what could be found in the administrative statistics. In any case, it is very difficult to construct comparable aggregates between the EUROMOD data and administrative data, as the variable includes an enormous variety of benefits originating from various different schemes (sickness, disability, occupational injury and occupational disease) that are further administered by different institutions depending on the workers' statute (employee, civil servant, the self-employed, pensioner), not all of which could provide the necessary statistics to construct comparable aggregates, and rough estimations were necessary (e.g. assuming similar evolutions in separate schemes). Moreover, part of the benefits allocated are not necessarily coming from government funds, but from (semi-)private insurers (e.g. in the case of occupational injury & disease) and could therefore not be included. Results for sickness & disability should thus be interpreted with great care, as it seems probable that the number of persons affected is underestimated and the incomes reported in this category may well originate from various sources that could not be validated.

### 5. *Maternity benefit*

Table 68 focuses on one specific sickness/disability allowance: the maternity benefit. Whereas the number of recipients is overestimated by 36% in the data, the total expenditures are underestimated by 18%. This could be due to weighting bias, as the number of newborns in the dataset is relatively small.

### 6. *Income support*

Finally, the non-simulated income support (social assistance) variable is presented in Table 69. First, an important disclaimer applies with respect to the official statistics used as external source in the validation exercise.

In Belgium, one has to distinguish between two measures for cash income support. First, regular income support (*regulier leefloon*) is allocated to Belgians and foreigners with a stable or long term residence permit (Belgians, EU-citizens, foreigners with permanent residence permit). An "equivalent" cash income support (*equivalent leefloon*) is allocated to persons whose statute is very precarious, e.g. candidate refugees, undocumented residents or temporary residing foreigners. Both types of income support are made up of the same amounts, only the financing is different. Previous validation analysis (cf. EUROMOD Country Report Belgium 2006-2010) revealed that persons receiving equivalent income support are barely captured in the SILC data, because only a small part of them belongs to the sample population of the SILC survey (the sample is drawn from the state register, while foreigners who receive equivalent income support are often registered in the foreigners register, and not in the state register). Therefore, the validation is carried out using the amounts and beneficiaries of regular income support only. One has to bear in mind, however, that this means that the most precarious foreign population in Belgium, for which on average the equivalent income support is an important income source) is not represented in these data.

The number of recipients is underestimated, the data captures 69% of the persons receiving income support in reality in 2012. The expenditures, on the other hand, are overestimated by 19%. This suggests that these families who were to a large extent dependent on income support, are over-

represented in the survey and/or less likely to underreport than families who have received smaller amounts of income support or for only a short period of time during the year.

### 4.1.3 Validation of outputted (simulated) incomes

#### 1. *Simulated income tax*

Table 71 shows that for the general federal income tax and the municipal income tax the number of fiscal units as well as the total taxes are very closely simulated in EUROMOD for the baseline year 2012. For the levy on income from capital gains, the special social security contribution and the levy on immovable property of households only the revenue is available. The special social security contribution is underestimated by 18%. As it is a well-known difficulty to adequately capture income from capital gains in survey data, the revenue of levy on income from capital gains and levy on immovable property of household is seriously underestimated in these data (91% and 73%). The data capture less than half of the revenue of the administrative statistics.

#### 2. *Simulated social contributions*

Table 72 presents the aggregated revenues from social insurance contributions. While employer social contributions correspond closely to the administrative data, the employee social insurance contributions are overestimated by 17% in EUROMOD. This divergence can be entirely explained by the fact that the database contains in relative terms too much income from employment (cfr. Table 61). From the observation that total gross wages in EUROMOD is 26% higher compared to the administrative sources, we would even expect a higher overestimation of total social insurance contributions.

The employer social contributions correspond relatively well the administrative statistics, despite the database's bias towards income from employment. In fact, lower employer social contributions are simulated on the micro-level because the data do not allow the implementation of the detailed components that make up the employer social insurance contribution, such as taxes on private pensions or the private use of company cars.

#### 3. *Child allowance (bch\_s)*

Although the number of children giving right to child allowance corresponds closely to the administrative sources, the total expenditure simulated for child benefit is slightly underestimated when compared to the administrative statistics (cfr. Table 72). One reason for this might be that the children's disability status is not observed in the data, which means that the higher allowances (normal amount times two) for handicapped children cannot be simulated.

#### 4. *Birth allowance (bchba\_s)*

According to the administrative statistics, the annual expenditures on birth allowance are overestimated by 9% in the EUROMOD simulations (cfr. Table 73, 2012). This can be due to small sample size, or the slightly higher number of newborns in the data, which also was the observation from Table 68 on maternity leave and which could have a similar effect on the simulated expenditures.

Also, the (un)availability of external statistics hinders a strict comparison between administrative sources and the EUROMOD database. There are no numbers available for the recipients from the civil servant social security scheme, so we had to estimate the evolutions assuming the same evolution of births in the civil servants scheme as in the employee scheme.

#### 5. *Income support (bsa\_s)*

The simulation of income support is implemented in the system, because the simulated income support is closer to the administrative data than the values recorded in the EU-SILC data, therefore the simulated values are included in the disposable income concept. The difficulty of simulating the

income support measures stems from capturing the means-test in the simulations and from the complex issue of non-take up.

Belgian Local Welfare Centres have large discretionary power over decisions about the eligibility of the applicant (see section 1.2.4). Typically, a very detailed means-test is performed which can only be partly simulated. In comparison to earlier versions of EUROMOD, we are now able to switch on the means-test on cadastral income (a measure indicating the value of the dwelling owned), improving the coverage of the means-test in the simulation. Second, the quality of the data available does not allow us to simulate this part sufficiently accurately. For instance, income from capital, an important element in the means-test, is not well captured in the SILC data. When full take-up is assumed the overestimation is too high, therefore a random correction is applied (in the form of a take-up correction) so that the aggregate number of recipients matches the official statistics validation income support – incomplete take-up).

The number of recipients in 2012 is calibrated to correspond to those reported in the external statistics. The total expenditure is very close to the external source as well. By keeping constant the take-up adjustment factor, the number of recipients closely corresponds to the official statistics over the period 2012-2015. The expenditure is overestimated by 39% (cfr. Table 74, 2012).

The take-up correction implemented in the system has the advantage that aggregate figures correspond, and in that way performs much better. Still, it is assumed that non-take up is a random phenomenon, ignoring the difference that the true, detailed means-test implies and the specific non-take up issues playing for different individuals and families. As discussed in the section on income support in paragraph 1.2.4, we decided to use the simulated income support with take-up correction for the validation of the characteristics of the income distribution.

A quick overview of the literature on non-take up of income support in Belgium:

- Between 1993-1995, based on research using the ECHP, 9.7% of the Belgian population was estimated to be eligible for social assistance, without making use of it. The researchers report that they have filtered as much as possible unreliable household income from the data before making these estimations (Nicaise & Groenez, 2002).

The number of persons receiving income support is overestimated by EUROMOD by 300%. This is about 4.5% of the working age population (between 18 & 65) in 2005. Although not strictly comparable, this figure is in line with the 9.7% over three years that was found in the ECHP data.

- Rotation in and out of social assistance is relatively high, with many people only being in this stage for a couple of months: For a sample of entrants for the period of June 1987 to November 1990, Cockx (1997) finds a median duration for women and men respectively of 4.5 and 6 months.
- Vercauteren en Daems (1995) point at the importance of the delay between becoming eligible and submitting the application. Based on half-open interviews with clients of the local centres for social assistance, they find that more than 50% of those are waiting a considerable amount of time before submitting their application (29% even more than 1 year). The main reasons that were quoted are that they did not know about the centres for social assistance, or the application procedure was feared to be too complex, they felt ashamed or they feared reclamation from family members.

This is in line with the observation that the number of recipients corresponds more closely to the official statistics than the total expenditures. Those who apply for income support with a delay, appear in the annual statistics as recipients but have received the benefit for a shorter time than what is simulated in EUROMOD, assuming immediate take-up.

### 6. *Income support for the elderly (bsaoa\_s)*

Similar to the issue for the regular income support, the income support for the elderly is implemented in the system, but is not included in the simulated disposable income. It is very difficult to interpret the simulated results, because it is unclear what is and what is not included in the income concept the means test is based upon. The reason is that it is impossible to find out to what extent the income support for the elderly is or is not included in the SILC survey. It seems that this benefit was mistakenly recorded as regular pension income in the majority of cases and is as such already included in the data. For other persons, it was not recorded at all, and only for a few cases the amount was correctly recorded in SILC as income support for the elderly. The means-test in the simulations is performed on the income as recorded in SILC, which means that the actually received income support for the elderly, when it was reported or included in the regular pension amount, was included in the income used to assess eligibility for this benefit. Of course, this is not correct.

Similar to income support, the amounts are still implemented in the system and the user can switch on the policy in the spine and include the simulated benefit (bsaoa\_s) in the disposable income. However, for the construction of the baseline simulated net disposable income, pensions (not simulated) are taken from the data (i.e. bsaoa\_s switched off by default).

Table 75 shows that the number of recipients is overestimated by 15 to 41% in EUROMOD. Aggregated expenditure seems more volatile (the overestimation is between 55% and 92%). On the one hand, this is an expected result, as income support functions as a top-up income, and we pointed out that it is probable that income support already received is inevitably included in the income base used in the means-test to assess eligibility. On the other hand, as the income on which the threshold is applied already contains this benefit for the persons taking up the benefit and for whom the amount is recorded in the regular pensions variable, we would expect that the persons who are in reality taking up this benefit and for whom this is recorded in the regular pension variable, should in this case already be above the eligibility threshold in the means test and thus should not be included as simulated recipients. This means that it is possible that the income support simulated in EUROMOD is mainly to the benefit of those who in reality do not make use of the benefit, even though they are eligible. The interpretation of the simulated results is thus far from being clear.

## 4.2 **Income distribution**

All income distribution results presented here are computed for individuals according to their household disposable income (HDI) equivalised by the “modified OECD” equivalence scale. HDI are calculated as the sum of all income sources of all household members net of income tax and social insurance contributions. The weights in the OECD equivalence scale are: first adult=1; additional people aged 14+ = 0.5; additional people aged under 14 = 0.3.

### 4.2.1 **Income inequality**

When compared to the SILC data income inequality is lower in EUROMOD. Both Gini and the S80/S20 measure are 21 to 35% lower for EUROMOD incomes than for SILC incomes (cfr. Table 77). Looking at the average income per decile (equivalised), we can see that the underestimation in EUROMOD is mainly driven by divergence in the extreme ends of the income distribution. Disposable income in the first decile is on average 41% higher when simulated by EUROMOD compared to SILC disposable incomes. In the 10<sup>th</sup> decile, on the other hand, EUROMOD simulated disposable income which is by 42% less than what is reported in SILC.

### 4.2.2 Poverty

Table 80 shows, depending on the threshold chosen, a gap between the EUROMOD income poverty figures and the external source poverty figures (calculated on the basis of the SILC data). The gap decreases (or the ratio comes closer to 1) when the poverty lines are higher. For the 60% and 70% of median income threshold, the gap is 20%. For the lowest poverty line (40% threshold), there remains a gap of 6%.

The size of the gap is due to a number of reasons. First, the poverty lines for the EUROMOD disposable incomes are slightly lower in comparison with the poverty lines calculated on the basis of the SILC disposable income. This is due to the fact that the medians differ (cfr. Table 76). The lower median value in EUROMOD leads to lower poverty lines (expressed as 60% of this median equivalent income), and thus possibly to poverty headcount according to these thresholds.

Secondly, as presented in the figures on income inequality (cfr. Table 77), net disposable incomes are overestimated in the bottom regions of the income distribution while underestimated in the top half of the income distribution. This has a direct impact on the number of individuals below the 60%-median income. The combined effect of a lower poverty line and higher net disposable incomes in the lower deciles in EUROMOD when compared to SILC has a strong influence on the discrepancy between both poverty figures.

Table 81 shows that the estimated discrepancy between the poverty figures from EUROMOD and from SILC is relatively evenly distributed over the age categories, except for the group of working age people.

### 4.3 Summary of “health warnings”

This final section summarises the main findings in terms of particular aspects of the Belgian part of EUROMOD or its database that should be borne in mind when planning appropriate uses of the model and in interpreting results.

- The sample is relatively small. Care should be taken in interpreting results for small sub-groups.
- Although aggregates correspond to some extent, care should be taken in interpreting results for beneficiaries of sickness & disability benefits, elderly with income support, as well as the early-retired as separate groups, as these seemed to be least clear how they were captured in the data.
- The number of employees (private sector) and the total aggregate income from employment are too overestimated in EUROMOD. It seems that this is primarily caused by the fact that employees are slightly overrepresented, while the recorded wages are representative for the Belgian population as a whole.
- On average, taxable income per tax unit is significantly higher in EUROMOD than in the administrative data. This is likely to be due to the fact (1) that the SILC data seem to contain too little low-income families (cf. next point), and (2) that some important deductible expenses are not simulated in EUROMOD (childcare expenses, actual costs incurred for the self-employed, donations to charity organisations, and other (more minor) deductible expenses).
- There is evidence to suggest that in some instances the SILC sample is not fully representative for the Belgian population. Especially persons and households with low earnings are underrepresented in these data.
- The amounts of income support are adjusted for the non take-up of benefits using a random non take-up correction.

## APPENDIX 1: POLICY EFFECTS IN 2013-2014 AND 2014-2015

Table 1 and Figure 1 show the effect of policy changes in 2013-2014 on mean equivalised household disposable income by income component and income decile group, as a percentage of mean equivalised household disposable income in 2013. Each policy system has been applied to the same input data, while monetary parameters of 2014 policies have been deflated by the Consumer Price Index (CPI).

We observe a 0.40% increase in disposable income between 2013 and 2014. The five bottom income deciles enjoyed a higher increase of 0.65% on average, with the largest increase (0.85%) in the second decile. In the top half of the distribution the increase was twice as low. The increases in public pensions (which were higher in lower deciles where pensioners are typically concentrated) have made the largest contribution to the growth in disposable income (0.55% on average). The income growth can also be explained by changes in direct taxes which have been reduced for the two bottom deciles due to the change in the tax credit for low-paid workers - the fiscal working bonus. It is a tax deduction for employees on low wages that are entitled to the social working bonus (i.e. a reduction in social contributions for employees if they satisfy certain income conditions). Starting from 2014 the size of the fiscal working bonus has increased from 5.7% to 8.95%.

Table 2 and Figure 2 show the effect of policy changes in 2014-2015 on mean equivalised household disposable income by income component and income decile group, as a percentage of mean equivalised household disposable income in 2014. Each policy system has been applied to the same input data, while monetary parameters of 2015 policies have been deflated by the June Belgian NSI CPI<sup>31</sup>.

We can see a different trend in 2014-2015 as compared to the previous year. The total change of the disposable income between 2014 and 2015 is negative (-0.90%). These negative changes are driven by the growth in direct taxes and social insurance contributions. The growth in direct taxes is due to the transfer of fiscal policy concerning housing, to the regions. The regions maintained the structure of the instrument with one important change: the benefit is no longer defined by the marginal tax tariff but by a fixed rate. From 2015 the amounts of the tax are no longer indexed. The growth in social insurance contributions for the self-employed is due to the fact that the income thresholds for annual incomes are not indexed compared to 2014.

Notes: shown as a percentage change in mean equivalised household disposable income by income component and income decile group. Income decile groups are based on equivalised household disposable income in 2014, using the modified OECD equivalence scale. Each policy system has been applied to the same input data, deflating monetary parameters of 2014 policies by the Consumer Price Index (CPI).

Figure 2: Policy effects in 2014-2015, using the CPI-indexation, %

Notes: Computed for individuals according to their household disposable income (HDI) equivalised by the “modified OECD” equivalence scale. HDI are calculated as the sum of all income sources of all household members net of income tax and social insurance contributions. Income concepts were not top-bottom coded and negative and zero-values are taken into account for calculating inequality indices.

Sources: calculations on the basis of EUROMOD (2012-2015) and SILC2012.
